## PREFACE

Statistics Canada published in June 1974 its first official population projections for Canada, provinces and territories to the year 2001. In response to many requests received from government departments and agencies as well as private corporations engaged in housing and public utilities, the programme on projections has been extended to provide household and family projections. This report contains the analysis of past trends in household and family growth, the formulation of projections hypotheses, the full description of the methodology adopted and the detailed tables of projection results.

Four alternative sets of projections are included in order to cover the plausible range of factors influencing the growth and structure of households and families. These projections are provided by sex, age and marital status of the heads of households and families. It must be emphasized that these projections are not predictions; they reflect the future growth and composition of households and families under the stated assumptions. Statistics Canada will follow a policy of revising these household and family projections whenever the population projections are revised.

Several persons were consulted on methodology and assumptions contained in this volume. While acknowledging their assistance, none of them is held responsible for these projections. Final assumptions were arrived at by a team including R. Beaujot, K.S. Gnanasekaran and D. Vanasse-Duhamel who jointly developed the Statistics Canada Household Projections Model (SCHM) and prepared this report for publication with the help of the staff of the Population Estimates and Projections Division, Census Field.

PETER G. KIRKHAM,  
*Chief Statistician of Canada.*

## PRÉFACE

En juin 1974, Statistique Canada publiait ses premières projections démographiques officielles pour le Canada, les provinces et les territoires jusqu'en l'an 2001. À la suite de nombreuses demandes de la part de ministères et d'organismes gouvernementaux ainsi que de sociétés privées du secteur de l'habitation et des services d'utilité publique, il a été décidé d'inclure des projections de ménages et de familles dans le programme de projections. La publication que voici présente l'analyse de l'évolution du nombre des ménages et des familles, les hypothèses et les méthodes utilisées et les tableaux détaillés des résultats de ces projections.

Quatre séries de projections ont été retenues afin de tenir compte des facteurs les plus susceptibles d'affecter dans l'avenir la croissance et la composition des ménages et des familles. Les résultats sont présentés selon le sexe, l'âge et l'état matrimonial des chefs de ménage et des chefs de famille. Il importe de signaler que ces projections ne sont pas des prédictions; elles ne font que refléter la croissance et la composition futures des ménages et des familles en fonction des hypothèses énoncées. Statistique Canada procédera à la révision de ces projections chaque fois que les projections démographiques seront elles-mêmes révisées.

Plusieurs spécialistes ont été consultés au sujet de la méthodologie et des hypothèses utilisées dans cet ouvrage. Tout en étant reconnaissants à ces personnes de leur contribution à cette étude, les auteurs en assument l'entière responsabilité. Le choix définitif des hypothèses a été fait par R. Beaujot, K.S. Gnanasekaran et D. Vanasse-Duhamel; cette équipe a élaboré le modèle de projection et rédigé ce document avec le concours du personnel de la Division des estimations et des projections démographiques, Secteur du recensement.

*Le statisticien en chef du Canada,*  
PETER G. KIRKHAM.

## Introduction

Household and family projections are increasingly in demand by government departments and industries. Long-range planning by housing agencies and private builders requires information on the future trends in the number and structure of households and families. Furthermore, the development of public utilities, construction of roads, and production of consumer durables such as electrical appliances and furniture, are directly dependent on future trends in households. More specifically, planners are often interested to know whether the future increase in the number of households is likely to be greater or smaller than the present growth. Interest has sometimes also centered on the future growth of the number of families, the number of married couples, and the distribution of families by type (i.e., primary or secondary).

In response to the foregoing demands, Statistics Canada has for the first time developed a programme of household and family projections that is coordinated with its main and regular programme of demographic projections. Accordingly, these projections are based on the Statistics Canada population projections published in June 1974.<sup>1</sup> This report, which represents the outcome of this new programme, presents a series of household and family projections for Canada and the provinces to the year 2001. The report also contains projections by age, sex and marital status of household and family heads.

These projections of households and families, as with the population projections, are not predictions. They are to be viewed as conditional projections reflecting the future scenarios if the stated assumptions regarding population, marriage and household formation do in fact occur during the projection period. Needless to say, such an occurrence is rare and therefore, alternative series of projections are made in the study. These series taken together are considered useful as they provide valuable insight into potential future changes in the number and structure of households and families.

This report contains three major parts. The first part deals with the methods and assumptions underlying the several series of household and family projections. The main trends and features which emerge from an analysis of the projections of house-

## Introduction

Le secteur public et le secteur privé font de plus en plus appel aux projections des ménages et des familles. Dans le domaine de l'habitation, par exemple, les spécialistes de la planification à long terme ont besoin de données sur l'évolution du nombre et de la structure des ménages et des familles. De plus, l'extension des services publics, la construction de routes et la production de biens durables tels que les appareils ménagers et les meubles sont intimement liées à l'évolution des ménages. Ainsi, les agents de planification sont souvent intéressés à savoir si la croissance du nombre de ménages se maintiendra ou non à son rythme actuel, d'autres aimeront connaître l'évolution du nombre de familles ou de couples mariés ou la répartition future des familles selon le genre de famille (principale ou secondaire).

En réponse à ces demandes, Statistique Canada a mis sur pied un programme de projection des ménages et des familles qui s'insère dans le cadre de son programme régulier de projections démographiques. Les chiffres présentés ici s'appuient donc sur les projections démographiques de Statistique Canada publiées en juin 1974<sup>1</sup>. Fruit de ce nouveau programme, la présente étude contient une série de projections des ménages et des familles établies pour le Canada et les provinces jusqu'en 2001. Le lecteur y trouvera également des projections selon l'âge, le sexe et l'état matrimonial des chefs de ménage et de famille.

Tout comme les projections démographiques, ces projections ne constituent évidemment pas des prédictions. Elles ne servent qu'à représenter l'évolution des familles et des ménages qu'on observerait si certaines hypothèses relatives à la population, au mariage et à la formation des ménages se réalisaient au cours de la période de projection. Comme il est rare que les hypothèses énoncées se réalisent en tous points, nous avons préparé plusieurs séries de projections. Grâce à l'ensemble de ces séries, le lecteur pourra avoir une assez bonne idée de l'évolution possible du nombre et de la structure des ménages et des familles.

Cette étude se compose de trois parties principales. La première est consacrée aux méthodes de projection des ménages et des familles et aux hypothèses qui les sous-tendent. Les principales tendances qui se dégagent de l'analyse des projections des ménages et des familles sont

holds and families are presented in the second part. In an effort to ensure that the users obtain these projections as early as possible, no attempt is made here to present a full analysis of the projection results.

Part three presents detailed tables containing projections series through 2001 for Canada, provinces and territories. Included also are the projections of population by marital status, age and sex for Canada and provinces to the year 2001. Further enquiries regarding the projections model and the unpublished or additional projections may be addressed to Dr. R. Beaujot, Population Estimates and Projections Division, Census Field, Statistics Canada, Ottawa K1S 5A4 (Telephone: 613-994-5204).

étudiées dans la deuxième partie. Toutefois, afin d'être en mesure de publier ces chiffres le plus rapidement possible, nous n'avons pas tenté de les analyser en profondeur.

Dans la troisième partie de l'étude, le lecteur trouvera des tableaux consacrés aux séries de projections établies jusqu'en 2001 pour le Canada, les provinces et les territoires. Cette partie contient également des projections démographiques selon l'état matrimonial, l'âge et le sexe, pour le Canada et les provinces, jusqu'en 2001. Les lecteurs qui aimeraient obtenir des renseignements sur le modèle de projection, des données non publiées ou d'autres projections devraient s'adresser à monsieur R. Beaujot, Division des estimations et des projections démographiques, Secteur du recensement, Statistique Canada, Ottawa K1S 5A4 (téléphone: 613-994-5204).

## **PART I**

METHODOLOGY AND ASSUMPTIONS

---

## **PARTIE I**

MÉTHODOLOGIE ET HYPOTHÈSES

## General Methodology and Data

The approaches generally adopted to project households and families include the following: (a) the vital statistics method, or (b) the headship rate method.<sup>1</sup> The previous projections for Canada provide a good example of the application of the vital statistics method.<sup>2</sup> The procedure basically involves projecting the formation and dissolution of families. It is assumed that marriages and the net immigration of married women add to the stock of families while divorces and deaths of married persons result in the dissolution of families. The main weakness of this procedure lies in the use of statistics on the events occurring to **individuals** as a base from which to draw conclusions about changes in family **units**. In fact, the "vital statistics" of families does not exist. Thus, the method does not allow for cases where, for example, a death of a married person does not result in the dissolution of a family. The vital statistics method is also weak in respect to the transition from families to households. This transition is made on the basis of trends in the proportion of families who maintain their own households, and in the proportion of family households to total households.

In view of the foregoing limitations of the vital statistics method, the present household and family projections model is based on the **headship rate method**.<sup>3</sup> A headship rate is defined as the proportion or number of heads in a given population. The headship rates are calculated in the model for various sub-groups, namely, those obtained by the cross-tabulation of age, sex and marital status. The projections of households and families are obtained by applying projected headship rates to the future population by various sub-groups. This approach has the basic advantage of making direct use of existing official population projections by age and sex.<sup>4</sup> In this manner, the projections also take clearly into consider-

## Méthodologie et données générales

Les projections des ménages et des familles se font généralement en utilisant les méthodes suivantes: a) la méthode des statistiques de l'état civil, ou b) la méthode des chefs de ménage<sup>1</sup>. Les projections qui ont été faites pour le Canada dans le passé constituent un bon exemple d'application de la méthode des statistiques de l'état civil<sup>2</sup>. Cette méthode repose essentiellement sur la projection de la formation et de la dissolution des familles. On suppose en effet que les mariages et l'immigration nette de femmes mariées viennent grossir le nombre de familles, alors que les divorces et les décès de personnes mariées contribuent à le faire diminuer. Le principal inconvénient de cette méthode est qu'on s'appuie sur des statistiques portant sur des **personnes** pour tirer des conclusions relatives à des **unités** familiales. Il n'existe pas, en effet, de statistiques de "l'état civil" portant sur les familles. Ainsi, cette méthode ne nous permet pas de tenir compte des cas où, par exemple, le décès d'une personne mariée ne se traduit pas par la dissolution d'une famille. La méthode des statistiques de l'état civil présente également certaines faiblesses en ce qui concerne le passage des familles aux ménages. Ce passage s'appuie sur l'évolution de la proportion des familles qui forment un ménage et de la proportion des ménages familiaux par rapport à l'ensemble des ménages.

Compte tenu des limites que présente la méthode des statistiques de l'état civil, nous avons choisi de faire nos projections des ménages et des familles en nous appuyant sur la **méthode des taux de chefs de ménage**<sup>3</sup>. Le taux de chefs est calculé en fonction de la proportion ou du nombre de chefs au sein d'une population donnée. Nous l'avons calculé pour divers sous-groupes établis en fonction de l'âge, du sexe et de l'état matrimonial des chefs. Les projections des ménages et des familles ont été calculées en appliquant les taux de chefs projetés à la population future des divers sous-groupes. Le principal avantage de cette méthode est qu'elle nous permet d'utiliser directement les projections démographiques officielles établies en fonction de l'âge et du sexe<sup>4</sup>. De cette

ation the changes in population structure which have a predominant effect on the number of families and households.

In the current model, a regional approach is adopted. In essence, this approach first involves the preparation of household and family projections for each province and territory of Canada, and secondly, the aggregation of these provincial projections to obtain the national projections. This approach enables the model to take into account the regional differentials regarding the parameters of household and family change.

The present projections are based on the Census results as of June 1, 1971 and are made for each year through 1986. In addition, these projections have been extended for the period 1986 - 2001 on the assumption that the different parameters will remain constant at the levels projected to the year 1986. The projections to the year 2001 are built into the model to comply with the demand for such projections in long-term planning. However, it must be emphasized here that the thrust of this study pertains primarily to the period 1971 - 1986.

### Features of the Model

The present Statistics Canada Household/Family Projections Model (SCHM) is very elaborate in design and follows closely its predecessor, the demographic model.<sup>5</sup> The SCHM, as stated previously, rests upon the application of the headship rate method to each province and territory. Structurally, the model consists of five blocks. Block 1 is devoted to detailed demographic projections by age and sex for each province and territory of Canada, and in the present instance, it contains the alternative series of population projections published by Statistics Canada in June 1974.<sup>6</sup> Block 2 deals with the distribution of population projections by marital status. The population 15 years and over is divided into three marital status categories by age and sex. These are: (a) single, (b) married spouse present, and (c) ever married spouse absent (or other). Projection inputs regarding headship rates are developed in Block 3 which forms the most vital part of the model. The headship rates are projected separately for three types: (a) primary family, (b) secondary family, and (c) non-family. In addition, the headship rates by these three types are treated separately for the various age, sex and marital status groups.

façon, nos projections nous permettent de tenir compte des variations de la structure de la population, qui, on le sait, ont un effet déterminant sur le nombre de familles et de ménages.

Dans notre modèle, nous avons adopté une approche régionale. Fondamentalement, cela veut dire que nous avons tout d'abord établi des projections pour les provinces et les territoires et que nous avons par la suite cumulé ces chiffres pour obtenir des projections à l'échelle nationale. Cette approche permet au modèle de tenir compte des disparités régionales dans les paramètres qui influencent l'évolution des ménages et des familles.

Les projections publiées ici sont fondées sur les résultats du recensement du Canada du 1<sup>er</sup> juin 1971 et ont été établies par année jusqu'en 1986. Les projections pour la période 1986 - 2001 reposent sur l'hypothèse que les divers paramètres demeureront constants à compter de 1986. Ce dernier groupe de projections a été fait pour répondre aux demandes des organismes de planification à long terme. Soulignons toutefois que nos efforts ont principalement porté sur la période 1971 - 1986.

### Caractéristiques du modèle

Le modèle de projection des ménages et des familles de Statistique Canada est très raffiné et s'apparente au modèle qui l'a précédé, le modèle démographique<sup>5</sup>. Comme nous l'avons déjà signalé, le modèle de projection des ménages et des familles fait appel à la méthode des taux de chefs observés dans les provinces et les territoires. Il est essentiellement composé de cinq blocs. Le bloc 1 est consacré aux projections démographiques détaillées (par âge et par sexe) pour les provinces et les territoires du Canada; pour les besoins de cette étude, il contient les diverses séries de projections démographiques publiées par Statistique Canada en juin 1974<sup>6</sup>. Le bloc 2 porte sur la répartition de la population en fonction de l'état matrimonial. Ainsi, la population de 15 ans et plus est répartie en trois catégories d'état matrimonial qui sont elles-mêmes ventilées en fonction de l'âge et du sexe. Ce sont: a) les célibataires, b) les personnes mariées dont le conjoint est présent, et c) les personnes non-célibataires dont le conjoint est absent (ou autre). Les données entrant dans le calcul des taux de chefs sont préparées dans le bloc 3, qui constitue en quelque sorte le coeur du modèle. Ces taux sont projetés séparément pour: a) les familles principales, b) les familles secondaires, et c) les ménages non familiaux. De plus, les taux de chefs de chacun de ces groupes sont ventilés suivant le sexe, l'état matrimonial et certains groupes d'âges.

<sup>6</sup> Statistique Canada, n° 91-514 au catalogue, 181 pp.

Block 4 contains the projections output (i.e., Block 2 X Block 3) for each province and territory. Block 5 produces the results for Canada by aggregating the provincial projections. The household and family projections are obtained as follows (see also Table 2.1).

Number of households = number of primary families + number of non-family households.

Number of families = number of primary families + number of secondary families.

Le bloc 4 contient les projections proprement dites (bloc 2 X bloc 3) pour les provinces et les territoires. Le bloc 5 sert à établir les résultats pour l'ensemble du Canada par agrégation des projections provinciales. Les projections des ménages et des familles sont obtenues comme suit (voir également le tableau 2.1).

Nombre de ménages = nombre de familles principales + nombre de ménages non familiaux.

Nombre de familles = nombre de familles principales + nombre de familles secondaires.

**TABLE 2.1. Nature of Projections, Input/Output of the Model**  
**TABLÉAU 2.1. Nature des données d'entrée et de sortie du modèle**

	Household projection Projection des ménages	Family projection Projection des familles
Block - 1 - Bloc: Population projections (age and sex) - Projections démographiques (âge et sexe) . . . Block - 2 - Bloc: Marital status - État matrimonial . . . . .	Single - Célibataire . . . . . Married spouse present - Marié conjoint présent . . . . . Other - Autres . . . . .	Single - Célibataire Married spouse present - Marié conjoint présent Other - Autres
Block - 3 - Bloc: Headship rate - Taux de chefs . . . . .	Primary family - Famille principale . . . . . Non-family household - Ménage non familial	Primary family - Famille principale Secondary family - Famille secondaire

The subsequent two chapters discuss in greater detail the data base and projection methodology regarding the marital status and headship rates in Blocks 2 and 3. The population projections data in Block 1 denote the official population projection for provinces and territories by age and sex to the year 2001. The methodology and assumptions underlying these series of population projections are summarized below.

### Population Projections Used

As stated earlier, the recent Statistics Canada population projections<sup>7</sup> are used in this report. The overall approach to these foregoing projections may be

<sup>7</sup> Statistics Canada, Catalogue 91-514, 181 pp. for a short summary, see K.S. Gnanasekaran, "Population Projections for Canada and the Provinces, 1972 - 2001", Paper presented at the Population Association of America Meetings, Seattle, 1975, 27 pp.

Dans les deux chapitres qui suivent, nous étudierons en détail la base de données et les méthodes de projection en ce qui concerne l'état matrimonial et les taux de chefs des blocs 2 et 3. Les projections démographiques du bloc 1 s'appuient sur les projections officielles pour les provinces et les territoires établies par âge et par sexe jusqu'en 2001. La méthodologie et les hypothèses sur lesquelles s'appuient ces séries de projections démographiques sont présentées de façon sommaire ci-dessous.

### Projections démographiques utilisées

Comme nous l'avons déjà souligné, cette étude s'appuie sur les dernières projections démographiques de Statistique Canada<sup>7</sup>. De façon générale, ces projections

<sup>7</sup> Cf. Statistique Canada, n° 91-514 au catalogue, 181 pp. et K.S. Gnanasekaran, "Population Projections for Canada and the Provinces, 1972 - 2001", document présenté lors d'une réunion de la Population Association of America tenue à Seattle, 1975, 27 pp.

called the **regional component** method. Within the framework of the regional component method, one mortality projection was made on the basis of the past trends in the causes of death, and four fertility projections (constant, high, medium and low) were developed on the basis of a three-parameter model.<sup>8</sup> Six migration projections (including zero migration), treating separately immigration, emigration, in-migration and out-migration for each province and territory of Canada, are incorporated in these projections.<sup>9</sup> Combinations of these assumptions, concerning the components of population change, lead to numerous population projections. However, Statistics Canada has selected four Projections A, B, C and D to indicate the range of future population of Canada and provinces to the year 2001. The specific assumptions underlying these projections are summarized in Table 2.2.

For the purpose of household and family projections, the fertility effect will not be felt over the next 15 years since the source population is that aged 15 years and over. Therefore, other factors being constant, projections with alternative assumptions about fertility will lead to the same results until 1986. For this reason, and since the mortality assumption is the same under all series, emphasis is placed on underlying migration assumptions in the selection of projections to be used in producing household and family projections.

From Table 2.2, it may be noted that Projection A assumes a net gain of 100,000 immigrants a year while Projections B, C and D imply a net gain of 60,000 immigrants a year. These series differ, however, with regard to the hypothesis concerning the volume and pattern of interprovincial migration. Projections B and C involve the same hypothesis regarding interprovincial migration, and the household and family projections would be the same, other things being equal, under these two series until 1986. In the light of foregoing considerations, the three Projections A, B and D are selected and stored in Block 1. However, the present model is versatile in the sense that alternative population projections can readily be substituted, and the related set of household and family projections can easily be produced.

<sup>8</sup> For a complete description of the model, see A. Romaniuk, "A Three Parameter Model for Birth Projections", *Population Studies*, Vol. XXVII, No. 3, November 1973, pp. 467-478.

<sup>9</sup> See also Statistics Canada, *Technical Report on Population Projections for Canada and the Provinces, 1972-2001*, Catalogue 91-516 (Ottawa: Information Canada, 1975), 233 pp.

reposent sur la méthode des **composantes régionales**. Dans le cadre de ces projections, on avait retenu une hypothèse de mortalité fondée sur l'évolution de la mortalité par cause de décès et quatre hypothèses de fécondité (constante, forte, moyenne et faible) développées à partir d'un modèle utilisant trois paramètres<sup>8</sup>. Six projections relatives aux migrations (y compris un solde migratoire nul) ont été établies et portent sur l'immigration, l'émigration et les migrations intérieures pour chaque province et territoire du Canada<sup>9</sup>. Les combinaisons de ces diverses hypothèses relatives aux facteurs de croissance démographique ont donné lieu à de nombreuses projections démographiques. Toutefois, Statistique Canada n'en a retenu que quatre (les projections A, B, C et D) de façon à couvrir l'éventail des possibilités de croissance de la population du Canada et des provinces jusqu'en 2001. Les hypothèses qui sous-tendent ces projections sont présentées de façon sommaire au tableau 2.2.

Dans la projection des ménages et des familles, seule la population de 15 ans et plus nous intéresse et donc la fécondité des 15 prochaines années n'a aucun effet. Ainsi, si l'on suppose que les autres facteurs demeurent constants, les projections qui s'appuieraient sur les diverses hypothèses relatives à la fécondité donneraient les mêmes résultats jusqu'en 1986. Pour cette raison, et comme l'hypothèse relative à la mortalité est la même dans toutes les séries, nous nous sommes principalement attachés aux hypothèses relatives aux migrations dans le choix des projections utilisées pour projeter le nombre de ménages et de familles.

À la lecture du tableau 2.2, on constate que, dans la projection A, on a supposé que le solde migratoire net s'établirait à 100,000 immigrants par an, alors que, dans les projections B, C et D, il se chiffrerait à 60,000 par an. Ces séries diffèrent, toutefois, en ce qui a trait à l'hypothèse relative au volume et à la structure des migrations interprovinciales. Dans les projections B et C, on a retenu la même hypothèse en ce qui concerne les migrations interprovinciales; toutes choses étant égales par ailleurs, ces deux projections des ménages et des familles devraient être identiques jusqu'en 1986. Nous avons donc choisi les projections A, B et D et nous les avons intégrées au bloc 1. Le modèle utilisé à l'heure actuelle demeure souple en ce sens qu'il est possible d'y faire figurer d'autres projections démographiques et de calculer les projections des ménages et des familles qui en découlent.

<sup>8</sup> Le lecteur trouvera une description complète du modèle dans A. Romaniuk, "A Three Parameter Model for Birth Projections", *Population Studies*, vol. XXVII, n° 3, novembre 1973, pp. 467-478.

### Projection of Marital Status Distribution

Traditionally, the population is divided into the marital status categories of single, married, widowed, separated and divorced. For the purpose of household and family projections, the model, instead of including these traditional categories, adopts the following three marital status groups: (1) single, (2) married spouse present, and (3) ever married spouse absent. The main advantage of this new grouping is that, by definition, all men married spouse present are heads of families. In addition, the projection can now be seen as two distinct breakdowns. A given age-sex group is first broken down into single and ever married. Secondly, the ever married group is partitioned into spouse present and spouse absent. It is important to note that ever married spouse absent is here defined to include widowed, divorced, as well as all other cases where husband and wife are not living together.

### Data and Methods

The base data utilized for these projections are taken from quinquennial Censuses since 1951 (see Appendix B for exact sources). The definitions for the categories are unchanged over this period and the data are available by five-year age groups. The period 1951 - 1971 was considered sufficient to establish the basic trends in marital status change.

There are basically two types of methods that can be used for projecting marital status: (a) component methods based on vital statistics data, and (b) methods involving the extrapolation of observed trends in the marital status distribution. On analytic grounds, the first method is in many regards more logical. However, it is not adopted here mainly because of the limited time available for this study.<sup>1</sup>

The extrapolation of past trends in the marital status distribution can be done in various ways. For a relatively closed population, the proportion single for

### Répartition selon l'état matrimonial

Traditionnellement, la population est distribuée suivant cinq catégories d'état matrimonial: célibataire, marié, veuf, séparé et divorcé. Pour faire nos projections des ménages et des familles, nous avons toutefois retenu un classement différent, qui comprend trois groupes: (1) les célibataires, (2) les personnes mariées dont le conjoint est présent, et (3) les non-célibataires dont le conjoint est absent. Le principal avantage de ce nouveau classement tient à ce que, par définition, tous les hommes mariés qui vivent avec leur épouse sont chefs de famille. En outre, les projections peuvent maintenant faire l'objet de deux ventilations distinctes. Ainsi, un groupe d'âge et de sexe donné peut être tout d'abord ventilé en "célibataires" et "non-célibataires". Le groupe des non-célibataires peut ensuite être subdivisé en "conjoint présent" et "conjoint absent". Il est important de souligner que les "non-célibataires conjoint absent" comprennent toutes les personnes veuves ou divorcées de même que toutes les personnes mariées qui ne vivent plus ensemble.

### Données et méthodes

Les données de base utilisées pour établir ces projections ont été tirées des recensements quinquennaux faits depuis 1951 (voir sources à l'appendice B). Les définitions des catégories que nous avons retenues n'ont pas changé au cours de cette période, et les données sont disponibles par groupes d'âges quinquennaux. Nous avons jugé que la période 1951 - 1971 était suffisamment longue pour permettre de dégager les principales tendances de l'évolution de l'état matrimonial.

Il existe fondamentalement deux types de méthodes qui peuvent être utilisées pour projeter l'état matrimonial: a) les méthodes des composantes, qui s'appuient sur les données de l'état civil, et b) les méthodes d'extrapolation fondées sur l'évolution de la répartition de la population selon l'état matrimonial. Du point de vue de l'analyse, il est, à bien des égards, plus logique d'adopter la première méthode. Toutefois, en raison du temps dont nous disposions pour préparer cette étude, nous avons dû procéder autrement<sup>1</sup>.

L'extrapolation des tendances de la répartition selon l'état matrimonial observées dans le passé peut être faite de diverses façons. Dans le cas d'une population relative-

<sup>1</sup> For an example in the use of component methods, see Hanne Spohr, "A Matrix Model for the Distribution of a Population According to Age, Sex and Marital Status", in United Nations, Economic Commission for Europe, *Housing Requirements and Demand: Current Methods of Assessment and Problems of Estimation*, United Nations, 1973, pp. 48 - 52.

<sup>1</sup> On trouvera un exemple d'utilisation de la méthode des composantes dans Hanne Spohr, "A Matrix Model for the Distribution of a Population According to Age, Sex and Marital Status", Nations Unies, Commission économique pour l'Europe, *Housing Requirements and Demand: Current Methods of Assessment and Problems of Estimation*, Nations Unies, 1973, pp. 48 - 52.

given generations can only decrease over time.<sup>2</sup> However, this analysis has to be carried forward at the provincial level where it is not possible to assume a closed population. For instance, interprovincial migration can cause the proportion single to increase over time for some cohorts in some provinces. Hence, a simpler method of extrapolating the marital status proportions for the various five-year age-sex groups is adopted here. The extrapolation is based on a modified exponential formula described fully in Chapter 4.

### Hypotheses and Projected Trends

The procedure adopted extends into the future the same change in marital status distribution as that observed during a given base period. For the present projections, after testing the results of different periods, it was decided to base the extrapolation on the observed changes between 1951 and 1971.

**Proportion single** — In the model, the first step involves the projection of the proportion (or per cent) single by age-group and sex for each province/territory through 1986. The projected proportions of single are presented in Table 3.1 and Chart 3.1. For convenience of analysis, these proportions are standardized in accordance with the age-sex distribution obtained in the 1971 Census. Historically, there has been a general decrease during 1951 - 1971 in the proportions single among the population aged 15 and over. The proportion for males declined from 35.8% to 31.6% in this period, and it is expected to drop further to 29.1% at the national level by 1986. Similarly, the proportion single for ages 15 and over is projected to reach 22.9% for females in 1986.

The provinces can be divided into three groups with respect to the proportion of their population that remains single. A first group, including Newfoundland, Ontario, Alberta and British Columbia, is characterized by low proportions of single population. At the opposite end of the scale, a second group includes the provinces of Prince Edward Island and Quebec with high proportions single or low nuptiality. The third group consisting of the remaining provinces has intermediate levels of proportions single or relative positions that are different for males and females. The projections for 1986, given in Table 3.1, retain this provincial pattern. Accordingly, it is anticipated that all regions would experience a continuous decrease in the proportions single (standardized for age). Thus, in 1986 the proportion single among males 15 and over is

ment fermée, la proportion des célibataires d'une génération donnée ne peut que diminuer avec l'âge<sup>2</sup>. Pour les fins de cette étude, nous avons dû faire notre analyse au niveau provincial et nous n'avons pas pu supposer qu'il s'agissait là de populations fermées. En effet, les migrations interprovinciales peuvent entraîner un accroissement de la proportion des célibataires dans certaines générations. Nous avons donc choisi d'adopter une méthode plus simple d'extrapolation des proportions de célibataires pour les divers groupes d'âges quinquennaux et pour chaque sexe. Cette extrapolation s'appuie sur une courbe exponentielle modifiée décrite en détail au chapitre 4.

### Hypothèses et tendances projetées

La méthode que nous avons adoptée prolonge dans le futur l'évolution de la répartition de l'état matrimonial observée au cours de la période de référence retenue. En ce qui concerne les projections qui nous occupent, nous avons choisi de fonder nos extrapolations sur les variations observées entre 1951 et 1971 après avoir analysé les résultats obtenus pour diverses périodes.

**Proportion de célibataires** — La première étape consiste à projeter la proportion (ou le pourcentage) de célibataires par groupe d'âges et selon le sexe pour chaque province et pour les territoires jusqu'en 1986. Ces résultats sont présentés au tableau 3.1 et dans le graphique 3.1. Pour en rendre l'analyse plus aisée, ces proportions ont été ajustées selon la méthode de la population-type (la population de référence est celle du Canada au recensement de 1971). On a pu constater que, de 1951 - 1971, la proportion des célibataires au sein de la population de 15 ans et plus a diminué. Ainsi, la proportion des célibataires de sexe masculin est passée de 35.8 % à 31.6 % et devrait tomber à 29.1 % au niveau national en 1986. De même, la proportion des célibataires de sexe féminin de 15 ans et plus devrait s'établir à 22.9 % en 1986.

Il est possible de répartir les provinces en trois groupes en ce qui concerne la proportion de leur population qui est demeurée célibataire. Composé de Terre-Neuve, de l'Ontario, de l'Alberta et de la Colombie-Britannique, le premier groupe est celui où la proportion des célibataires est la plus faible. À l'opposé, c'est dans le deuxième groupe (formé de l'Île-du-Prince-Édouard et du Québec) que la proportion des célibataires est la plus élevée ou, en d'autres termes, que la nuptialité est la plus faible. Dans les autres provinces (le troisième groupe), on a observé des proportions intermédiaires de célibataires ou un classement différent suivant le sexe. Les projections pour 1986 sont présentées au tableau 3.1 et elles présentent la même répartition provinciale. On peut donc prévoir que la proportion des célibataires (l'âge étant ajusté) continuera à diminuer dans l'ensemble des régions.

<sup>2</sup> For examples in the use of cohort methods, see R. Pressat, "Un essai de perspectives de ménages", *Congrès international de population*, Vienne, 1959, pp. 112-121; and W.S. Hocking, "A Method of Forecasting the Future Composition of the Population of Great Britain by Marital Status", *Population Studies*, Vol. 12, No. 2, 1958, pp. 131-148.

<sup>2</sup> Le lecteur trouvera des exemples d'utilisation de la méthode des cohortes dans R. Pressat, "Un essai de perspectives de ménages", *Congrès international de population*, Vienne, 1959, pp. 112-121, et W.S. Hocking, "A Method of Forecasting the Future Composition of the Population of Great Britain by Marital Status", *Population Studies*, vol. 12, n° 2, 1958, pp. 131-148.

expected to vary from 26.8% in Alberta to 32.2% in Prince Edward Island compared to the observed range between 30.1% (in Ontario) and 35.8% (in Yukon) in 1971.

Two factors are mainly responsible for the change in the proportions single over time and the differences among provinces. These are: (1) the level of nuptiality, and (2) the timing of nuptiality. The proportion single in the age group 50 - 54 can be used as an index of the level of nuptiality. Likewise, the mean age at marriage can be used as a measure of the timing of nuptiality. This mean age is calculated from the proportion single using a formula developed by Hajnal.<sup>3</sup> It must be noted that this Hajnal index does not measure the behaviour of actual cohorts. It is used here only as an index of the relative position of provinces with respect to the timing of nuptiality.

It can be seen from Table 3.2 that the level of nuptiality has increased considerably for both sexes since 1951. This increase is projected to continue into the future, but to a lesser degree. Table 3.3 shows that the mean age at marriage has decreased continuously for males. However, for females there is a decrease to 1961 but an increase after this date. This divergent trend between the sexes might be explained by the notion of a marriage squeeze, i.e., the higher proportion of females on the marriage market in recent years may be responsible for the increase in their average age at marriage.<sup>4</sup> For the projection years, the mean age at marriage for males is expected to continue its slight downward trend, while for females the upward trend of recent years is expected to undergo a slight reversal. As females become less numerous on the marriage market, one could expect a continuation of the long-term decline in their average age at marriage.<sup>5</sup>

Tables 3.2 and 3.3 also imply a further decrease in age at marriage and an increase in nuptiality (proportions ever married) in the provinces. It may be noted that Quebec would be among the group with low nuptiality mainly because of its high average age at marriage. Ontario and British Columbia would continue to have high nuptiality or low levels of proportions single in the future.

Ainsi, en 1986, la proportion des célibataires de sexe masculin de 15 ans et plus devrait osciller entre 26.8 % en Alberta et 32.2 % à l'Île-du-Prince-Édouard, alors qu'elle se situait à 30.1 % en Ontario et 35.8 % au Yukon en 1971.

Ces variations dans le temps et d'une province à l'autre sont principalement imputables à deux facteurs: (1) l'intensité de la nuptialité, et (2) l'effet du calendrier. La proportion des célibataires de 50 - 54 ans peut être utilisée pour mesurer l'intensité de la nuptialité. De même, l'âge moyen au mariage peut servir à mesurer l'effet du calendrier. Cet âge moyen est calculé à partir de la proportion des célibataires à l'aide d'une formule mise au point par Hajnal<sup>3</sup>. Il convient de souligner que cet indice de Hajnal ne sert pas à mesurer le comportement réel des générations. En effet, il n'est utilisé ici que comme indice de la position relative de chaque province du point de vue du calendrier de la nuptialité.

À la lecture du tableau 3.2, on constate que l'intensité de la nuptialité a considérablement augmenté pour les deux sexes depuis 1951. D'après les projections, cet accroissement devrait se maintenir dans l'avenir, mais à un moindre degré. Le tableau 3.3 révèle que l'âge moyen au mariage a diminué de façon constante chez les personnes de sexe masculin. Chez les femmes, par contre, il a diminué jusqu'en 1961, mais a augmenté par la suite. Cet écart est probablement attribuable au fait que, au cours des dernières années, le nombre de femmes en âge de se marier a augmenté plus que celui des hommes, ce qui a donné lieu à un accroissement de leur âge moyen au mariage<sup>4</sup>. Pour les années sur lesquelles portent nos projections, l'âge moyen au mariage des hommes devrait continuer à augmenter légèrement, alors que la tendance à la hausse observée chez les femmes au cours des dernières années devrait s'inverser. En effet, comme le nombre relatif de femmes en âge de se marier baisse, on peut s'attendre à ce que la diminution de leur âge moyen au mariage se poursuive<sup>5</sup>.

Les tableaux 3.2 et 3.3 révèlent également que l'âge au mariage continuera à diminuer dans les provinces et que le taux de nuptialité (proportion de non-célibataires) augmentera. Fait à signaler, le Québec compte parmi les provinces où le taux de nuptialité est le plus faible, surtout parce que l'âge moyen au mariage y est élevé. En Ontario et en Colombie-Britannique, le taux de nuptialité devrait continuer à être élevé.

<sup>1</sup> Total ever married equals the number ever married spouse absent plus ever married spouse present. — Non-célibataires conjoint présent et conjoint absent.

Source: See Appendix B for 1951 - 1971, see text for method of projection (Population Projection D). — Voir l'appendice B pour 1951 - 1971, voir le texte pour la méthode de projection (projection de population D).

**Proportion of ever married spouse absent** – The second step in preparing marital status projections concerns the group of ever married persons for whom no spouse is present, i.e., widowed, separated and divorced. The projection strategy here is to treat this group as a part of the total ever married group including both married spouse absent and married spouse present. The married spouse absent constituted about 11.4% of the total ever married males 15 years and over in 1951 and 10.9% in 1971. These percentages were higher among females around 17.6% and 20.0% respectively. For purpose of the present projections, these percentages were extrapolated using the above exponential formula. The projected proportions of ever married spouse absent in the total ever married population are given by age groups and sex in Table 3.4.

For females, it is seen that, after the younger ages, the proportion spouse absent increases rather rapidly with age. In addition, there has generally been an upward trend over time. The increase in divorce rates, particularly in recent years, could be responsible for part of this trend. A more important aspect has been the widening gap between the average life span of men and women.<sup>6</sup> This differential, coupled with the younger mean age at marriage of females, has resulted in the increasing proportions of widowed females. Since there is nothing to indicate that this sex differential in mortality will decrease, the projected trends seem reasonable in proposing a continued increase in the proportion spouse absent among the ever married female population.

For males, the proportion spouse absent increases less rapidly with age. Figures for 1951 - 1971 show that there have been increases over time for age groups under 50 but decreases for ages 50 and over. The trend in the earlier ages can again be explained by the increase in divorces. At older ages, the trend would be a function of both the disadvantaged position of males with respect to mortality, and their advantaged position with respect to re-marriage. Since these trends can be expected to continue, the present projections appear reasonable.

The proportions spouse absent among the total ever married group are given by provinces in Chart 3.2. It is seen that these values vary over a relatively narrow range. For males in 1971, the range is from 9.8%

**Proportion de non-célibataires dont le conjoint est absent** – La deuxième étape du calcul des projections de l'état matrimonial porte sur le groupe des non-célibataires dont le conjoint est absent (personnes veuves, séparées ou divorcées). Dans ce cas, la méthode de projection consiste à considérer ce groupe comme faisant partie de l'ensemble des non-célibataires, c'est-à-dire aussi bien ceux dont le conjoint est présent que ceux dont le conjoint est absent. Les non-célibataires dont le conjoint est absent représentaient environ 11.4 % de l'ensemble des hommes non-célibataires de 15 ans et plus en 1951; en 1971, ce pourcentage était passé à 10.9 %. Chez les personnes de sexe féminin, il s'établissait respectivement à environ 17.6 % et 20.0 %. Ces proportions ont été extrapolées à l'aide de la courbe exponentielle dont il a été question ci-dessus. Les projections des pourcentages de non-célibataires dont le conjoint est absent par rapport à l'ensemble des non-célibataires sont données par groupe d'âges et selon le sexe au tableau 3.4.

En ce qui concerne les femmes, on observe que, chez les moins jeunes d'entre elles, la proportion de celles dont le conjoint est absent s'accroît rapidement avec l'âge. En outre, on constate que, de façon générale, cette proportion augmente d'année en année. Ce phénomène peut être attribué à l'accroissement du taux des divorces, particulièrement au cours des dernières années, et surtout au fait que l'écart entre la longévité moyenne des hommes et celle des femmes n'a cessé de s'accroître<sup>6</sup>. Associée à la diminution de l'âge moyen au mariage des femmes, cette différence de longévité a entraîné une augmentation de la proportion des veuves. Comme rien ne semble indiquer que l'écart entre l'espérance de vie des hommes et celle des femmes va diminuer, il est normal que nos projections présument que la proportion des femmes non-célibataires dont le conjoint est absent continuera d'augmenter.

En ce qui concerne les hommes, la proportion de ceux dont le conjoint est absent s'accroît de façon moins marquée avec l'âge. De plus, les chiffres de 1951 - 1971 révèlent que cette proportion a augmenté chez les personnes de moins de 50 ans, mais qu'elle a diminué chez celles de 50 ans et plus. Chez les premiers, cela vient probablement de l'augmentation du nombre de divorces. Pour ce qui est des hommes de 50 ans et plus, cette tendance est sans doute imputable à leur position désavantageuse face à la mortalité et à leur position avantageuse en ce qui concerne le remariage. Comme il est probable que ces tendances se prolongeront dans l'avenir, nos projections semblent raisonnables.

Le graphique 3.2 est consacré aux proportions de conjoints absents parmi l'ensemble des non-célibataires. En 1971, ces proportions se situaient, pour les hommes, entre 9.8 % à Terre-Neuve et 17.3 % au Yukon. En 1986,

(Newfoundland) to 17.3% (Yukon). In 1986, the range is expected to be from 9.4% (Newfoundland) to 13.4% (British Columbia). Females have slightly larger ranges: 13.2% to 22.3% in 1971 and 10.2% to 23.3% in 1986.

**Proportion married spouse present** – As indicated above, the total population was first separated into single and ever married. As a second step, the ever married population was divided into spouse absent and spouse present. However, a further adjustment is necessary because the number of males married spouse present must equal the number of females married spouse present. When this equality is not observed in projection results, the number of males married spouse present are taken as given in the model and the number of females are adjusted accordingly. The difference in the number of women was distributed equally among single and ever married spouse absent.

Chart 3.3 presents the distribution, by age groups, into the three marital statuses. In the total male population aged 15 and over, 60.2% were married spouse present in 1951 and 61.0% in 1971. The projections indicate that this proportion would be 66.6% in 1986. For females, the equivalent proportions married spouse present are 61.2% in 1951, 60.0% in 1971 and 64.4% in 1986. It will be noted that these results partly reflect the changing age structure of the population. For instance, by 1986 the lower birth cohorts of recent years will be among the population aged 15 and over. When considering proportions married, they will have little effect on the number married but they will be included in the population at risk (aged 15 and over). This will tend to inflate the proportions married in comparison to earlier years.<sup>7</sup>

on prévoit qu'elles oscilleront entre 9.4 % à Terre-Neuve et 13.4 % en Colombie-Britannique. Chez les femmes, les écarts sont légèrement plus importants: 13.2 % à 22.3 % en 1971 et 10.2 % à 23.3 % en 1986.

**Proportion de personnes mariées dont le conjoint est présent** – Comme nous l'avons déjà souligné, la population a tout d'abord été répartie en célibataires et non-célibataires. Dans une deuxième étape, les non-célibataires ont été ventilés en "conjoint absent" et "conjoint présent". Comme le nombre d'hommes mariés dont le conjoint est présent doit être égal au nombre de femmes mariées dont le conjoint est présent, nous avons dû faire un certain nombre d'ajustements. Lorsque nous n'arrivions pas à obtenir cette égalité, nous avons conservé le nombre d'hommes mariés dont le conjoint est présent que nous donnait le modèle et nous avons ajusté le nombre de femmes en conséquence. L'écart ainsi obtenu a été réparti également entre les femmes célibataires et les femmes non-célibataires dont le conjoint est absent.

Dans le graphique 3.3, la population est répartie par groupe d'âges en fonction de ces trois catégories d'état matrimonial. Ainsi, on observe qu'en 1951, 60.2 % des hommes de 15 ans et plus étaient mariés et vivaient avec leur conjoint; en 1971, cette proportion s'établissait à 61.0 %. Selon nos projections, ce pourcentage devrait s'établir à 66.6 % en 1986. Pour ce qui est des femmes, ces proportions s'établissent à 61.2 % en 1951, 60.0 % en 1971 et 64.4 % en 1986. On remarquera que ces résultats reflètent en partie l'évolution de la structure par âge de la population. Par exemple, les générations moins nombreuses nées ces dernières années auront 15 ans et plus en 1986. Si l'on considère la proportion des personnes mariées, l'inclusion de ces générations dans le calcul aura peu d'effet sur le numérateur (le nombre de femmes mariées), mais leur incorporation au dénominateur (la population soumise au risque) entraînera une augmentation de la proportion des mariés par rapport aux années précédentes<sup>7</sup>.

<sup>7</sup> For further analysis, particularly of interprovincial differences in nuptiality, see Diane Vanasse-Duhamel, "Projection de la population selon l'état matrimonial, Canada et provinces, 1971 - 2001", unpublished background paper, May 1975.

<sup>7</sup> Le lecteur trouvera une analyse plus approfondie, en particulier des variations interprovinciales de la nuptialité, dans l'étude de Diane Vanasse-Duhamel intitulée "Projection de la population selon l'état matrimonial, Canada et provinces, 1971 - 2001", document non publié, mai 1975.

### Projections of Headship Rates

The previous chapter presented the projections of the population distribution by age, sex and marital status. These are the key demographic variables of the projection model described in Chapter 2. The other parameter of the model is non-demographic and it involves the headship rates. A headship rate is defined as the number of heads of households or of families per 100 persons in a given population group. Generally, the headship rates vary by specific age groups, sex and marital status. These specific rates are in turn governed by a number of economic, social and cultural factors. The purpose of this chapter is to describe the methodology for the projections of headship rates, and to postulate future trends in household and family headship rates, by various age, sex and marital status groups, for adoption in the projections model.

#### Base Data

The present study focuses on the following characteristics of heads: sex, marital status (single, married spouse present, or other), and age (15 - 24, 25 - 34, 35 - 44, 45 - 54, 55 - 64, or 65 +). The choice of these categories was determined by availability of data and analytic utility. Though a finer age breakdown would have been preferable, it was not available. As regards marital status, the above three categories are chosen for certain analytical advantages that will become evident in subsequent pages.

In order to calculate headship rates, one therefore needs data on the population in each of the above categories and on the number of heads having these characteristics. Statistics Canada produces yearly estimates of families but these do not cross-classify the age, sex and marital status characteristics of heads. Thus, available data are effectively limited to Census years, and the statistical series for the five quinquennial Censuses between 1951 and 1971 has been utilized here (see Appendix B for exact sources). It must be noted that the Census tabulations used include collective households and consequently, throughout this report, the term household includes both private and collective households (see Glossary in Appendix A).<sup>1</sup> It is also to be indicated that the Census tabulations

### Projection des taux de chefs

Dans le chapitre qui précède, nous avons présenté les projections de la population en fonction de l'âge, du sexe et de l'état matrimonial, variables démographiques principales du modèle de projection décrit dans le chapitre 2. Les autres variables et les paramètres à caractère non démographique utilisés dans la projection des ménages et des familles font appel aux taux de chefs. Le taux de chefs correspond au nombre de chefs de ménage ou de famille pour 100 personnes dans une population donnée. De façon générale, les taux de chefs varient en fonction de l'âge, du sexe et de l'état matrimonial. Ces taux sont à leur tour soumis à l'influence de facteurs économiques, sociaux et culturels. Dans ce chapitre, nous nous proposons de décrire la méthode de projection des taux de chefs et d'étudier l'évolution future des taux de chefs de ménage et de famille en fonction de l'âge, du sexe et de l'état matrimonial afin de choisir ceux que nous utiliserons dans notre modèle de projection.

#### Données de base

Nous nous attacherons principalement aux caractéristiques suivantes des chefs: le sexe, l'état matrimonial (célibataire, marié conjoint présent ou autre), et l'âge (15 - 24, 25 - 34, 35 - 44, 45 - 54, 55 - 64 ou 65 +). Le choix de ces catégories a été fait en fonction de la disponibilité des données et de leur valeur du point de vue de l'analyse. Il aurait été préférable de constituer des groupes d'âges de cinq ans; toutefois, les données dont nous disposons ne nous le permettaient pas. En ce qui concerne l'état matrimonial, nous avons retenu ces trois catégories en raison de leurs avantages du point de vue de l'analyse, avantages qui seront mis en évidence dans les pages qui suivent.

Pour être en mesure de calculer les taux de chefs, il faut donc pouvoir disposer de données sur la population de chacune de ces catégories et sur le nombre de chefs qui possèdent ces caractéristiques. Statistique Canada publie annuellement des estimations du nombre de familles; ces chiffres ne sont toutefois pas répartis en fonction de l'âge, du sexe et de l'état matrimonial des chefs. Nous nous sommes donc appuyés sur les séries statistiques établies à l'occasion des cinq recensements quinquennaux faits entre 1951 et 1971 (voir sources à l'appendice B). Il convient de souligner que les tableaux du recensement que nous avons utilisés portent également sur les ménages collectifs; les chiffres sur les ménages publiés ici incluent donc aussi bien les ménages privés que les ménages collectifs (cf. glossaire de l'appendice A)<sup>1</sup>. Signalons également que les

<sup>1</sup> The proportion of households that are collective is always very small. In 1971, there were 17,585 collective households which amounted to 0.29% of all households (hand count available from Characteristics Division, Statistics Canada).

<sup>1</sup> La proportion des ménages collectifs par rapport à l'ensemble des ménages a toujours été très faible. En 1971, il y avait 17,585 ménages collectifs, soit 0.29 % de l'ensemble des ménages (chiffre obtenu de la Division des caractéristiques de Statistique Canada).

exclude a certain number of "persons" for whom the relationship to head of household at the usual place of residence could not be determined. These are persons who were enumerated as temporary residents of collective households and who did not indicate relationship to head of household at the usual residence. It is difficult to say how many of these are heads of households or families. In any case, these heads are excluded both from the Census and the projection results.<sup>2</sup>

### Method of Projection

Three techniques have generally been used for projecting headship rates. These are (1) regression method, (2) normative approach, and (3) extrapolative method.<sup>3</sup> The regression method relates headship rates to such factors as income and urbanization. This technique will not be adopted here because there are no available long-term projections of these related factors. The normative approach proceeds on the basis of certain target headship rates. Generally speaking, this procedure is more appropriate for policy-oriented projections. The extrapolative method projects headship rates on the basis of the past trend and this technique has been adopted in this study.

The particular formula used to project headship rates involves a modified exponential extrapolation. Essentially, the modification involves extrapolation on the basis of change in headship rates between two points, i.e., the beginning and the end of the base period. If one is projecting to 1986 using the base period 1951 - 1971, the formula operates as follows:

**Formula A** — If the headship rate is decreasing between 1951 and 1971:

$$R_{1986} = R_{1951} \left( \frac{R_{1971}}{R_{1951}} \right)^{\frac{1986 - 1951}{1971 - 1951}}$$

or

$$R_{1986} = R_{1951} \left( \frac{R_{1971}}{R_{1951}} \right)^{1.75}$$

where:  $R_{1986}$  is the projected headship rate in 1986,

$R_{1951}$  is the headship rate in 1951, and

$R_{1971}$  is the headship rate in 1971.

tableaux du recensement excluent un certain nombre de personnes dont il a été impossible de déterminer le lien avec le chef de ménage à la résidence habituelle. Aux fins du recensement, ces personnes sont celles qui ont été considérées comme résidents temporaires d'un ménage collectif et qui n'ont pas donné leur lien avec le chef du ménage à la résidence habituelle. Il est difficile d'établir la proportion d'entre elles qui étaient chefs de ménage ou de famille. Quoi qu'il en soit, ces chefs ne figurent ni dans les résultats du recensement, ni dans nos projections<sup>2</sup>.

### Méthode de projection

Pour projeter les taux de chefs, on a en général le choix entre trois méthodes: (1) la méthode de régression, (2) la méthode normative, et (3) la méthode d'extrapolation<sup>3</sup>. La méthode de régression consiste à établir un rapport entre les taux de chefs et des facteurs tels que le revenu et le niveau d'urbanisation. Cette technique a été écartée car nous ne disposons pas de projections à long terme de telles variables. La méthode normative vise à amener les taux de chefs à un niveau correspondant à un objectif ou à une norme fixée d'avance. De façon générale, elle convient mieux au calcul de projections servant à l'établissement de programmes. La méthode d'extrapolation consiste à projeter les taux de chefs en fonction des tendances observées dans le passé; c'est celle que nous avons retenue pour les fins de cette étude.

La formule utilisée pour projeter les taux de chefs s'appuie sur une courbe exponentielle modifiée. Essentiellement, cette modification donne lieu à une extrapolation fondée sur l'évolution des taux de chefs entre deux points (le début et la fin de la période de référence). Si l'on fait des projections jusqu'en 1986 à l'aide de la période de référence 1951 - 1971, la formule s'utilise comme suit:

**Formule A** — Si le taux de chefs diminue de 1951 à 1971:

où  $R_{1986}$  est le taux de chefs projeté pour 1986,

$R_{1951}$  est le taux de chefs de 1951, et

$R_{1971}$  est le taux de chefs de 1971.

<sup>2</sup> For more information on household and family data in 1971, see Sylvia T. Wargon, "The 1971 Census Housing, Household and Family Data: Some Technical Aspects and Considerations" (Statistics Canada, Characteristics Division), *Research Memorandum*, No. 71-HOU-6, May 1, 1975.

<sup>3</sup> See United Nations, Department of Economic and Social Affairs, *Methods of Projecting Households and Families*, Population Studies No. 54 (New York: United Nations, 1973), 100 pp.

<sup>2</sup> Le lecteur trouvera de plus amples renseignements sur les données de 1971 sur les ménages et les familles dans Sylvia T. Wargon, "The 1971 Census Housing, Household and Family Data: Some Technical Aspects and Considerations" (Statistique Canada, Division des caractéristiques), *Research Memorandum*, n° 71-HOU-6, 1<sup>er</sup> mai 1975.

<sup>3</sup> Cf. Nations Unies, Département des affaires économiques et sociales, *Méthodes de projection des ménages et des familles*, Études démographiques n° 54 (New York, Nations Unies, 1974), 110 pp.

**Formula B** – If the headship rate is increasing between 1951 and 1971:

$$R_{1986} = 100.0 - (100.0 - R_{1951}) \times \left( \frac{100.0 - R_{1971}}{100.0 - R_{1951}} \right)^{1.75}$$

The use of the above exponential formula imposes two important constraints. First, negative values will be avoided. This constraint is very essential as negative headship rates are meaningless. Second, through the use of complements as in Formula B above, the resulting headship rates are seen not to exceed the value of 100.0.

In this chapter, the foregoing formulae are applied to each of the sub-populations obtained through the cross-tabulation of age, sex and marital status for each province. There are, however, a few sub-groups that can be dealt with differently. The female married spouse present sub-group has, by definition, household and family headship rates of zero. This group can, therefore, be immediately eliminated from the analysis. Also, the male married spouse present is a special case since its family headship rate is by definition 100.0. Thus, the major emphasis can be focused on male single, female single, male other (ever married spouse absent) and female other.

For the present purpose of household and family projections, it is useful to use three non-overlapping types of heads: heads of primary families, heads of secondary families and heads of non-family households (see Glossary in Appendix A). The addition of the first two types gives the total families while the first and third types gives the total households. Once a person is one of these three types of heads, he or she is no longer subject to the risk of being another type of head. That is, the headship rate for all three types combined cannot exceed the value of 100.0. This rate for all types combined will henceforth be referred to as the total headship rate. To take advantage of the constraining value of the total headship rate, the headship rates for the three types as well as the total headship rate are first projected. Second, the projected values for the three types are adjusted, generally downward, so that their sum is equal to the projected value for the total headship rate.<sup>4</sup>

### Headship Rate Hypotheses

On the basis of the above formula, a number of projections can be derived using various base periods. As the statistical series starts in 1951, four potential

**Formule B** – Si le taux de chefs augmente de 1951 à 1971.

L'utilisation de cette formule exponentielle nous impose deux importantes contraintes. Premièrement, nous évitons ainsi les valeurs négatives; cette contrainte est fondamentale, les taux de chefs négatifs n'ayant aucune signification. Deuxièmement, en raison de l'utilisation de compléments (cf. formule B), les taux de chefs ne peuvent être supérieurs à 100.0.

Dans ce chapitre, ces formules seront appliquées à chacune des sous-populations qu'on obtient par croisement des diverses caractéristiques (âge, sexe et état matrimonial) dans chacune des provinces. Il existe toutefois certains sous-groupes qui peuvent être abordés différemment. Ainsi, le taux de chefs de ménage et de famille du sous-groupe des femmes mariées dont le conjoint est présent est, par définition, égal à zéro. Ce groupe peut donc être d'office éliminé de l'analyse. De même, le taux de chefs de famille du groupe des hommes mariés dont le conjoint est présent est évidemment égal à 100.0. Notre analyse portera donc sur les hommes célibataires, les femmes célibataires, les autres hommes (non-célibataires dont le conjoint est absent) et les autres femmes.

Au moment de calculer les projections des ménages et des familles, il est préférable d'utiliser trois groupes de chefs qui n'ont aucun point en commun: les chefs de famille principale, les chefs de famille secondaire et les chefs de ménage non familial (voir glossaire de l'appendice A). La fusion de ces deux premiers types de famille correspond à l'ensemble des familles, alors que l'addition du premier et du troisième type de chefs nous donne l'ensemble des ménages. Ainsi, dès lors qu'une personne appartient à l'un de ces types de chefs, elle ne peut pas appartenir à un autre groupe. En d'autres termes, le taux de chefs de ces trois groupes pris ensemble (c'est-à-dire le taux de chefs global) ne peut être supérieur à 100.0. Afin de tirer avantage de cette contrainte, les taux de chefs de chacun des trois groupes et le taux de chefs global ont été projetés en premier. Dans une deuxième étape, les valeurs projetées ont été ajustées (généralement à la baisse) de telle façon que leur somme soit égale au taux de chefs global<sup>4</sup>.

### Taux de chefs – Hypothèses

Si l'on utilise la formule donnée ci-dessus, il est possible de faire un nombre important de projections en utilisant diverses périodes de référence. Notre série statisti-

<sup>4</sup> For more information on this technique, including simulated results on past trends and comparisons with other formulae, see Roderic Beaujot, "Projections of Headship Rates by Marital Status, Age and Sex for Canada and the Provinces to 2001", unpublished background paper, May 1975.

<sup>4</sup> Le lecteur trouvera d'autres renseignements sur cette technique (chiffres obtenus par simulation sur les tendances observées dans le passé, comparaisons avec d'autres formules, etc.) dans Roderic Beaujot, "Projections of Headship Rates by Marital Status, Age and Sex for Canada and the Provinces to 2001", document non publié, mai 1975.

base periods present themselves: 1951 - 1971, 1956 - 1971, 1961 - 1971 and 1966 - 1971. After a careful consideration of the results from each of these base periods, it was decided to adopt the following two headship rate hypotheses:

**Hypothesis A** – The future annual change in headship rates by age, sex, marital status and province is expected to be the same as the observed annual change between 1951 and 1971. In Chart 4.1 which shows the projected headship rates, it will be seen that this series presents a lower hypothesis with respect to the proportion of heads in the various sub-groups.

**Hypothesis B** – The future change in headship rates is expected to be equivalent to the observed change between 1961 and 1971. Thus, this hypothesis is based on change over the shorter term and it presents the higher hypothesis as evident from Chart 4.1.

The following section introduces various arguments in defense of these two hypotheses. This justification is basically done through an analysis of the consistency between past trends and projected trends. For instance, we will consider various individual rates at the national level and a series of standardized rates at the provincial level. There will also be an analysis of the convergence-divergence and the lead-lag among regions. (As regards the neglected base periods 1956-1971 and 1966-1971, it could be noted that they tend to provide mixed hypotheses. That is, they produce high results for some population groups but low results for other groups.)

## Projected Trends

Chart 4.1 illustrates the projected trend in the headship rates at the national level. The total headship rate is presented since this rate is used as a constraint in the projection model.<sup>5</sup> In addition, the projected headship rates for households and families by age, sex and marital status are given in Tables 4.1 to 4.3. By definition, the total headship rates for the sub-group of married spouse present are always 100.0 for males and zero for females. Therefore, the tables only give the rates for single and ever married spouse absent.<sup>6</sup>

<sup>5</sup> The total headship rate is the proportion of heads of all types (primary family, secondary family, non-family) in a given population group. This total rate is in fact quite similar to the household headship rate since secondary families only represent 8.7% of all heads in 1951 and 2.8% in 1971.

<sup>6</sup> The national projections are always obtained by adding over the 12 provinces and territories. However, the expected headship rates given in Chart 4.1 and Tables 4.1 to 4.3 are those obtained by projecting the national rates directly.

que ayant comme point de départ 1951, il est donc possible de définir quatre périodes de références: 1951 - 1971, 1956 - 1971, 1961 - 1971 et 1966 - 1971. Après avoir fait une étude minutieuse des résultats obtenus à l'aide de chacune de ces périodes de référence, nous avons choisi de retenir les deux hypothèses suivantes.

**Hypothèse A** – Les variations annuelles futures des taux de chefs par âge, sexe, état matrimonial et province devraient s'apparenter à celles qu'on a observées de 1951 à 1971. À la lecture du graphique 4.1, consacré aux projections des taux de chefs, on constatera que cette hypothèse conduit à des résultats moins élevés en ce qui concerne la proportion de chefs des divers sous-groupes.

**Hypothèse B** – L'évolution des taux de chefs devrait être identique à celle qu'on a pu observer de 1961 à 1971. Cette hypothèse s'appuie donc sur une période moins longue et nous donne des taux plus élevés (cf. graphique 4.1).

Dans la section qui suit, nous étudierons divers arguments à l'appui de chacune de ces hypothèses. Cette justification s'appuiera fondamentalement sur une analyse de l'accord entre les tendances passées et projetées. Par exemple, nous analyserons divers taux au niveau national et une série de taux comparatifs au niveau provincial. Nous examinerons également les résultats régionaux du point de vue de leur convergence ou de leur divergence et de leur décalage dans le temps. (Pour ce qui est des périodes de référence que nous n'avons pas retenues – 1956 - 1971 et 1966 - 1971 – nous avons constaté qu'elles entraînaient des résultats composites: les chiffres étaient souvent élevés pour certains groupes de population et faibles pour d'autres.)

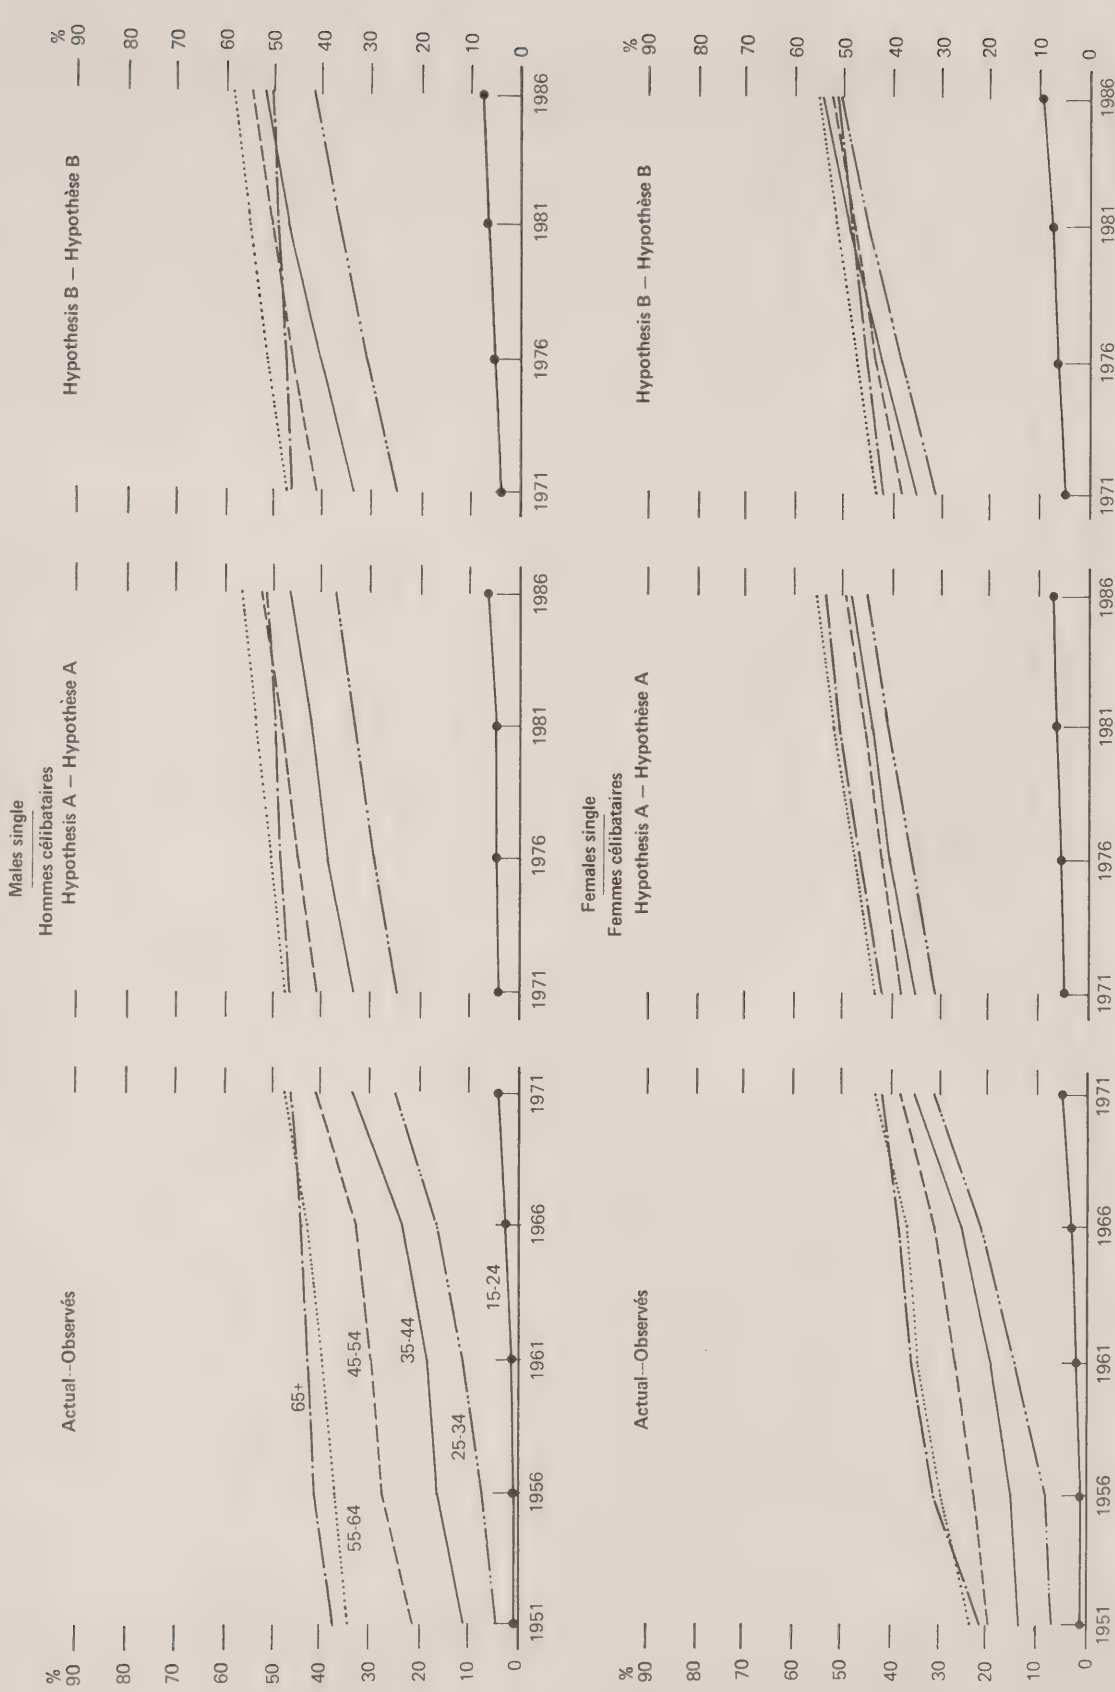

## Projection des tendances

Le graphique 4.1 est consacré aux projections des tendances des taux de chefs au niveau national. Nous y avons fait figurer le taux de chefs global car il constitue l'une des contraintes du modèle de projection<sup>5</sup>. Le lecteur trouvera également aux tableaux 4.1 à 4.3 des projections des taux de chefs de ménage et de famille en fonction de l'âge, du sexe et de l'état matrimonial. Par définition, le taux de chefs global des personnes mariées dont le conjoint est présent est toujours égal à 100.0 pour les hommes et zéro pour les femmes. Le tableau ne porte donc que sur les taux des célibataires et des non-célibataires dont le conjoint est absent<sup>6</sup>.

<sup>5</sup> Le taux global de chefs correspond à la proportion des chefs de famille principale, de famille secondaire ou de ménage non familial au sein d'une population donnée. Ce taux s'apparente en fait au taux de chefs de ménage, étant donné que les chefs de famille secondaire ne représentaient que 8.7 % de l'ensemble des chefs en 1951 et 2.8 % en 1971.

<sup>6</sup> Les projections au niveau national sont toujours obtenues par agrégation des résultats pour les provinces et les territoires. Toutefois, les taux de chefs donnés dans le graphique 4.1 et dans les tableaux 4.1 à 4.3 ont été obtenus directement.

Actual and Projected Headship Rates for All Types of Heads, by Marital Status,  
Age and Sex of Head, Canada, 1951-1986

# Actual and Projected Headship Rates for All Types of Heads, by Marital Status, Age and Sex of Head, Canada, 1951-1986

Taux de chefs observés et projetés pour tous types de chefs, selon l'état matrimonial, l'âge et le sexe du chef, Canada, 1951-1986

**Total headship rate** — In Chart 4.1, the total headship rates vary considerably by age, sex and marital status. Projected trends almost always indicate increases in total headship rates over time. This increase is probably related most directly to general economic growth and the desire of individuals to seek privacy as one of the components of their rising standard of living. Migration is another factor that may explain the upward trend in headship rates. One would expect that with increasing individual mobility there is a concomitant splitting of larger dwelling units. These trends of long-term economic growth, desire for privacy and individual mobility will likely continue in future, and consequently lead to further increases in headship rates.

The trends for **single** males and females indicate very consistent increases. Similar graphs at the provincial level show very few exceptions to the upward trend in total headship rates in each age group. It is noteworthy that female single total headship rates have been higher than equivalent male rates for ages 15 - 44. The opposite situation holds at ages 45 and over; that is, male headship rates are higher. These may partly be due to an earlier entry of females into the labour force and to the higher economic resources of males at older ages. This differential is expected to remain unchanged during the projection period.

The results for **ever married spouse absent** are less consistent. On the other hand, looking at base periods 1951 - 1971 and 1961 - 1971, there is only one case that shows a decrease in total headship. This decrease occurs for female (ever married spouse absent) at ages 15 - 24 when considering base period 1951 - 1971. However, analogous graphs at the provincial level have more cases of decreases in headship over given base periods. When they occurred, these decreases were observed in Prince Edward Island, Newfoundland, Saskatchewan, Nova Scotia, New Brunswick, Alberta and Northwest Territories (in that order of relative frequencies). It will be noted that these are mostly out-migration areas, and it is likely that ever married spouse absent males and females often move out of these regions when becoming heads of households or families. The lower headship rates for those who remain are therefore not statistical artifacts, but a real situation that may well be found in the future.

Comparing males and females, it can be seen that, during both base and projection periods, female ever married spouse absent have higher overall headship rates than their male counterparts. This is probably a reflection of the fact that separated and divorced females are more often heads of families. As regards

**Taux de chefs global** — À la lecture du graphique 4.1, on constate que les taux globaux de chefs varient considérablement en fonction de l'âge, du sexe et de l'état matrimonial. Les tendances projetées indiquent presque toujours que le taux de chefs global s'accroîtra. Cette augmentation est probablement directement associée à l'amélioration de la situation économique générale et à une tendance à l'individualisme née de l'amélioration du niveau de vie. Les migrations peuvent également expliquer l'accroissement des taux de chefs. En effet, en raison de l'accroissement de la mobilité de la population canadienne, les unités familiales ont tendance à se fractionner. Comme on peut prévoir que ces tendances continueront à s'observer dans l'avenir, les taux de chefs ont de fortes chances de s'accroître.

Chez les **célibataires** de sexe masculin et de sexe féminin, le taux de chefs s'est accru de façon constante. Une lecture des graphiques provinciaux nous apprend en effet que, à quelques rares exceptions près, les taux globaux de chefs de tous les groupes d'âges s'accroissent. Il est intéressant de remarquer que les taux globaux de chefs des femmes célibataires de 15 - 44 ans sont plus élevés que ceux des hommes célibataires du même groupe d'âges. À l'inverse, chez les personnes de 45 ans et plus, le taux de chefs est plus élevé chez les hommes. Cela vient probablement de ce que les femmes entrent souvent plus tôt sur le marché du travail et que les ressources financières des hommes sont supérieures aux âges élevés. Cet écart devrait se maintenir au cours de la période de projection.

Les résultats obtenus pour les **non-célibataires conjoint absent** sont moins uniformes. D'autre part, si l'on observe les périodes de référence 1951 - 1971 et 1961 - 1971, on constate que le taux global de chefs n'a diminué que dans un seul cas. Cette diminution s'est produite chez les personnes de sexe féminin de 15 - 24 ans au cours de la période de référence 1951 - 1971. Toutefois, une lecture des graphiques provinciaux comparables nous apprend qu'il y a eu plusieurs diminutions des taux de chefs au cours des diverses périodes de référence. Ces diminutions se sont produites, par ordre de fréquence, à l'Île-du-Prince-Édouard, à Terre-Neuve, en Saskatchewan, en Nouvelle-Écosse, au Nouveau-Brunswick, en Alberta et dans les Territoires du Nord-Ouest. On remarquera qu'il s'agit là surtout de régions d'émigration nette; il est donc possible que les non-célibataires dont le conjoint est absent quittent ces régions lorsqu'ils deviennent chefs de ménage ou de famille. Les faibles taux de chefs qu'on peut observer pour les personnes qui demeurent dans ces régions ne sont donc pas artificiels; ils correspondent à une situation réelle qu'on pourra probablement observer dans l'avenir.

Si l'on étudie la situation des non-célibataires conjoint absent du point de vue du sexe des chefs, on constate que le taux de chefs a été et demeurera plus élevé chez les femmes que chez les hommes. Ce phénomène est probablement imputable au fait que les femmes séparées ou divorcées sont plus souvent chefs de famille que les

differences among marital statuses, it is quite common that single have lower headship rates than ever married spouse absent. Once a marriage has occurred in an individual's life, he or she is more likely to continue to prefer the additional privacy of being a household or family head.

**Primary family headship** — Tables 4.1 to 4.3 present essentially similar information to that available in Chart 4.1. This time the headship rates are separated into the three following types: primary family heads, secondary family heads and non-family heads. Projection results are also given for Hypotheses A and B. These tables give a better idea of the number of separate projections being made. Equivalent results for the 12 provinces and territories will not be presented here. Though several categories are projected (12 provinces and territories, three headship types, five marital status-sex groups, six age groups), the emphasis should be placed on the gross results rather than on each individual category. The separate categories would be subject to statistical error which would cancel out in the gross totals. This amount of detail is only presented in order to make available a data series which is useful at least for broad comparative purposes.

Primary family headship rates are naturally very close to zero for the single population (Table 4.1). In most cases, there have been slight increases in the age, sex, marital status specific rates over time. This increase is most predominant in the younger age groups of male married spouse present and female ever married spouse absent.

**Secondary family headship** — Headship rates for secondary families are uniformly low and decreasing (Table 4.2). It is only in the younger age groups of female ever married spouse absent that these rates exceed 10% for Canada in 1971. By 1986, it is expected that rates will be below 10% for all groups.

**Non-family headship** — As seen in Table 4.3, non-family headship rates have increased rather substantially since 1951. This increase is apparent in all age, sex and marital status groups. For older age groups, the non-family headship rates have increased to over 40% of the relevant population in 1971. Naturally, the married spouse present groups take exception to this since their non-family headship rates are always zero. Among the single population, male rates are higher than female rates at ages 35 and over. Among the ever married spouse absent population, male rates are higher at younger ages, but at ages 55 and over, female rates are higher. Similar differentials are expected by 1986, with rates over 50% in the older age groups.

hommes dans la même situation. En ce qui concerne l'état matrimonial, il arrive assez souvent que les taux de chefs soient moins élevés chez les célibataires que chez les non-célibataires dont le conjoint est absent. En effet, lorsqu'une personne a déjà été mariée, elle est plus portée à vouloir demeurer chef de ménage ou de famille.

**Taux de chefs de famille principale** — Les tableaux 4.1 à 4.3 contiennent essentiellement les mêmes renseignements que le graphique 4.1. Les taux de chefs sont ici ventilés en trois groupes: les chefs de famille principale, les chefs de famille secondaire et les chefs de ménage non familial. Les projections y sont également données en fonction des hypothèses A et B. Ces tableaux nous donnent une meilleure idée du nombre de projections distinctes qui ont été faites. Nous n'étudierons pas ici les résultats obtenus pour les diverses provinces et territoires. Bien que les projections aient été faites pour diverses catégories (12 provinces ou territoires, trois types de chefs, cinq groupes faisant intervenir l'état matrimonial et le sexe, six groupes d'âges), nous avons préféré mettre l'accent sur les résultats dans leur ensemble; ils sont en effet plus fiables que les chiffres obtenus pour chacune des catégories. Les tableaux sont cependant suffisamment détaillés pour qu'on puisse en tirer une série de données qui permettent de faire certaines comparaisons, si grossières fussent-elles.

Les taux de chefs de familles principales sont évidemment assez près de zéro chez les célibataires (tableau 4.1). Dans la plupart des cas, on observe que les divers taux par âge, sexe et état matrimonial se sont légèrement accrus et que cette augmentation a été plus marquée chez les jeunes hommes mariés dont le conjoint est présent et chez les femmes non-célibataires dont le conjoint est absent.

**Taux de chefs de famille secondaire** — Les taux de chefs de famille secondaire sont uniformément faibles et diminuent (tableau 4.2). Pour l'ensemble du Canada en 1971, ils n'ont été supérieurs à 10 % que chez les jeunes femmes non-célibataires dont le conjoint est absent. En 1986, ces taux devraient être inférieurs à 10 % chez tous les groupes.

**Taux de chefs de ménage non familial** — Le tableau 4.3 révèle que les taux de chefs de ménage non familial ont augmenté sensiblement depuis 1951, quels que soient l'âge, le sexe et l'état matrimonial. Chez les personnes plus âgées, les taux de chefs de ménage non familial sont passés à plus de 40 % en 1971. Les personnes mariées dont le conjoint est présent constituent évidemment des exceptions, puisque leur taux de chefs de ménage non familial est toujours égal à zéro. Chez les célibataires de 35 ans et plus, les taux observés pour les hommes sont plus élevés que ceux des femmes. Chez les non-célibataires dont le conjoint est absent, ce sont les hommes jeunes et les femmes de plus de 55 ans qui ont les taux les plus élevés. Les mêmes écarts devraient s'observer en 1986; les taux devraient alors être supérieurs à 50 % chez les personnes âgées.

### Projected Headship Rates by Provinces

To summarize briefly the provincial trends, this section presents some standardized indices for past and projection periods. These indices are calculated as the number (or per cent) of heads that there would be in a region and year if the rates for that region and year were applied to a standard population. The standard adopted is the national population in 1971 with its distribution by age, sex and marital status. In this type of calculation, the standard acts as a set of weights by which to summarize a series of rates. Such a summary measure decreases the number of comparisons that need to be made. On the other hand, there is always an element of arbitrariness in the selection of a particular set of weights.<sup>7</sup> Results thus differ depending on the standard population adopted. The particular categories used will also affect the results. For instance, we are here using six age groups and three marital statuses. A finer breakdown along these variables would doubtlessly produce different results. However, the interest here is in producing some broadly comparable summary results. Thus the problems involved in standardizing will be neglected for the sake of simplicity.

Tables 4.4 and 4.5 present standardized general headship rates (i.e., per cent of heads in population aged 15 and over). Table 4.4 presents these standardized household headship rates for Canada, provinces and territories, at the Census years since 1951. The projected rates are also given for quinquennial Census years to 1986 according to Hypothesis A (1951 - 1971 base period) and Hypothesis B (1961 - 1971 base period). In addition, the mean, standard deviation and coefficient of variation over the 12 provinces and territories are given for each year.

These results show continuous increases in the general household headship rates. These increases are mostly due to the increase in non-family household heads. The increase in non-family households was discussed earlier to be related to various general factors such as long-term economic growth, individual mobility and the desire for privacy. Since these factors are likely to continue into the future, it seems reasonable to expect that the increases in household headship will extend into the projection period.

Since 1956, Manitoba, Saskatchewan, Alberta, British Columbia, Yukon and Northwest Territories have had higher rates than the national average. Ontario has a non-family household headship rate that is above the national average. The primary family

### Projection des taux de chefs par province

Dans cette section, nous ferons un bref résumé des tendances au niveau provincial; à cette fin, nous étudierons certains indices comparatifs pour les périodes passées et futures. Ces indices correspondent au nombre (ou au pourcentage) de chefs qui se trouveraient dans une région pour une année donnée si les taux observés pour cette région et cette année étaient appliqués à une population-type. La population-type retenue est celle du Canada en 1971; elle est répartie par âge, sexe et état matrimonial. Cette population-type permet en fait de pondérer les taux, et facilite ainsi les comparaisons. D'autre part, comme il y a toujours une part d'arbitraire dans le choix de la population-type<sup>7</sup>, les résultats varient en fonction de celle-ci. Les catégories qu'on utilise agissent elles aussi sur les résultats. Par exemple, nous utilisons ici six groupes d'âges et trois catégories d'état matrimonial. Si nous avions utilisé une classification plus détaillée, nous aurions sans doute obtenu des résultats différents. Toutefois, comme nous cherchions avant tout à obtenir des chiffres nous permettant de faire des comparaisons d'ensemble, nous ne nous attarderons pas ici à examiner la question du choix de la population-type.

Les tableaux 4.4 et 4.5 sont consacrés aux taux généraux de chefs (pourcentage de chefs au sein de la population de 15 ans et plus). Le tableau 4.4 présente les taux comparatifs de chefs de ménage pour le Canada, les provinces et les territoires pour les années de recensement depuis 1951. Les taux projetés y sont également donnés jusqu'en 1986 en fonction de l'hypothèse A (période de référence 1951 - 1971) et de l'hypothèse B (période de référence 1961 - 1971). Le lecteur y trouvera en outre la moyenne, l'écart-type et le coefficient de variation pour les provinces et les territoires, pour chacune des années d'observation.

À la lecture des résultats, on constate que le taux général de chefs de ménage a augmenté de façon continue. Cet accroissement est pour une bonne part attribuable à l'augmentation de la proportion des chefs de ménage non familial. Cette augmentation du nombre de ménages non familiaux a été étudiée plus tôt et semble être associée à des facteurs tels que l'amélioration générale des conditions économiques, l'accroissement de la mobilité et la tendance à l'individualisme. Comme ces facteurs s'observeront vraisemblablement dans l'avenir, il semble raisonnable de prévoir que les augmentations des taux de chefs de ménage se poursuivront.

Depuis 1956, le Manitoba, la Saskatchewan, l'Alberta, la Colombie-Britannique, le Yukon et les Territoires du Nord-Ouest ont enregistré des taux supérieurs à la moyenne nationale. Le taux de chefs de ménage non familial est supérieur à la moyenne nationale en Ontario;

<sup>7</sup> See, for instance, Evelyn M. Kitagawa, "Components of a Difference Between Two Rates", *Journal of the American Statistical Association*, Vol. 50, No. 272, 1955, pp. 1,168 - 1,194, and "Standardized Comparisons in Population Research", *Demography*, Vol. 1, No. 1, 1964, pp. 296 - 315.

<sup>7</sup> Voir, par exemple, Evelyn M. Kitagawa, "Components of a Difference Between Two Rates", *Journal of the American Statistical Association*, vol. 50, n° 272, 1955, pp. 1,168 - 1,194, et "Standardized Comparisons in Population Research", *Demography*, vol. 1, n° 1, 1964, pp. 296 - 315.

headship rate is, however, below the national average. Notwithstanding, as a result of the growing trend of non-family households, Ontario is expected to be in the group of provinces with high household headship rates. In addition, the comparison among provinces in each year indicates that there is general stability over time in the ranking of provinces. This stability of rank orders is true both for past and projection periods.

le taux de chefs de famille principale, cependant, y est inférieur à la moyenne nationale. Toutefois, en raison de l'augmentation de la proportion des ménages non familiaux, l'Ontario fera partie du groupe de provinces qui ont un taux élevé de chefs de ménage. Une comparaison des taux annuels provinciaux révèle que l'ordre des provinces à cet égard est demeuré et restera relativement stable.

Since an increase in household headship rates is being observed, it is useful to consider questions of lead and lag among regions. One might expect, for instance, that the whole of the country would catch up to the leading province after a certain lag period. A lag period of 10 years appears to provide a reasonable fit to this historical series. In 1961, the highest ranking province was Alberta with a general household head-

Puisque nous avons observé une augmentation des taux de chefs de ménage, il peut être révélateur de voir quelles sont les régions qui sont en tête et combien de temps mettront les autres pour les rattraper. On peut en effet supposer, par exemple, que l'ensemble du pays rattrapera une province en avance après un certain nombre d'années. Pour les besoins de cette étude, une période de rattrapage de 10 ans semble suffisante. En effet, en 1961,

ship rate of 39.0%. In 1971, a decade later, the Canadian average was 39.9%. Thus, the highest headship rate province appears to be reached at the national level after a lag of 10 years. In 1971, the highest ranking province was Alberta with a rate of 41.8%. According to Hypothesis A, the 1981 Canadian average would be about the same at 41.8%. Hypothesis B, which emphasizes the more rapid recent change, yields a Canadian average of 42.4% in 1981, i.e., 0.6% higher than the observed lead of Alberta in 1971. In terms of the lead-lag theory, these results can be interpreted to retain a certain element of consistency.

Table 4.5 presents the family headship rates for the provinces. It can be seen that, once age, sex and marital status are controlled, family headship rates have been rather stable over time. This stability is mostly a function of the trade-off between a decrease

c'est en Alberta que le taux général de chefs de ménage était le plus élevé (39.0 %). Dix ans plus tard, en 1971, la moyenne canadienne s'établissait à 39.9 %. Ainsi, il a fallu attendre 10 ans avant que le pays ne rattrape la province où le taux de chefs était le plus élevé. En 1971, la province où le taux était le plus élevé était toujours l'Alberta (41.8 %). Selon l'hypothèse A, la moyenne nationale devrait donc s'établir à près de 41.8 % en 1981. Selon l'hypothèse B, dans laquelle les variations se font plus rapidement, la moyenne nationale devrait être de 42.4 % en 1981, soit 0.6 % de plus qu'en Alberta en 1971. On peut donc affirmer que ces résultats sont relativement cohérents.

Le tableau 4.5 est consacré aux taux de chefs de famille des diverses provinces. Une fois que l'âge, le sexe et l'état matrimonial sont contrôlés, on constate que les taux de chefs de famille sont relativement stables. Cette stabilité est en majeure partie attribuable au fait que la

<sup>1</sup> This is the per cent of heads in the population aged 15 years and over. These rates are standardized in accordance with Canada's population in 1971, by marital status, age and sex. — Le taux général est le pourcentage de chefs dans la population âgée de 15 ans et plus. La population-type, utilisée dans tous les calculs, est celle du Canada en 1971 selon l'état matrimonial, l'âge et le sexe.

Source: See Appendix B for 1951 - 1971, see text for method of projection. — Voir l'appendice B pour 1951 - 1971, voir le texte pour la méthode de projection.

in secondary families and a slight increase in primary families. In addition, while people may be forming families at slightly younger ages, there is also more dissolution of families either through marital separations or through the departure of children. More generally, as has already been noted in Chapter 3, marriage patterns have remained reasonably stable in recent years, and therefore, no great change in the proportion of family heads in the population can be expected. The projection results generally imply a continuation of the stability in the standardized general family headship rates.

It is also valuable to consider how specific provinces and territories deviate from the national average in given years. In 1951, the following have standardized family headship rates that are lower than the national average: Ontario, British Columbia and Yukon. This pattern remains basically unchanged to 1971 except that Alberta is added to the above group. In the projection period, for both hypotheses, Ontario, Saskatchewan, Alberta and British Columbia have lower rates than the national average. In general then, Table 4.5 indicates a high level of consistency of trends from the base to projection periods, and the provinces are expected to maintain the same differential pattern as in the past.

diminution du nombre des familles secondaires a été compensée par une légère augmentation du nombre de familles principales. En outre, même si les personnes semblent former des familles alors qu'elles sont de plus en plus jeunes, on constate que le nombre de dissolutions des familles augmente, soit en raison des séparations, soit à cause du départ des enfants. De façon générale, on remarque toutefois que la structure de la nuptialité est demeurée relativement stable au cours des dernières années et qu'il ne faut donc pas s'attendre à ce que la proportion des chefs de famille varie de façon sensible. Nos projections révèlent d'ailleurs que les taux généraux ajustés de chefs de famille devraient demeurer stables.

Il est également intéressant de voir dans quelle mesure les provinces et les territoires s'écartent de la moyenne nationale au cours de certaines années. En 1951, par exemple, l'Ontario, la Colombie-Britannique et le Yukon avaient des taux ajustés de chefs de famille inférieurs à la moyenne nationale. En 1971, la situation était demeurée fondamentalement la même, si ce n'est que l'Alberta était venue grossir le rang de ces provinces. Au cours de la période de projection, l'Ontario, la Saskatchewan, l'Alberta et la Colombie-Britannique enregistrent des taux inférieurs à la moyenne nationale dans les deux hypothèses. De façon générale, le tableau 4.5 révèle que les tendances observées au cours de la période de référence et les écarts entre les diverses provinces demeureront inchangés.

## **PART II**

HOUSEHOLD AND FAMILY PROJECTIONS

---

## **PARTIE II**

PROJECTIONS DES MÉNAGES ET DES FAMILLES

## Projections Results

The previous chapters have elaborated on the choice of three population projections (A, B and D), two marital status assumptions (constant and variable pattern) and three headship rate assumptions (constant, low and high). Numerous projections of households and families can now be obtained through alternative combinations of these assumptions (see Appendix C). After a careful evaluation, four series, henceforth called Projections 1, 2, 3 and 4, were chosen to indicate the prospective range in the number of households and families in Canada and the provinces over the period 1971 - 2001. The specific assumptions underlying these four projections are summarized in Table 5.1. The projections were produced in considerable detail: by age, sex and marital status of head; by type of household or family; by each province and territory; and by each year to 1986 and thereafter, at five-year intervals, to the year 2001. These projection output contain a wealth of implications for the future of Canadian society. Due to lack of time and resources, only some implications are highlighted in the following Sections A and B devoted to household and family projections respectively.

## Résultats des projections

Dans les chapitres précédents, nous avons analysé les critères qui nous ont amenés à choisir trois projections démographiques (A, B et D), deux hypothèses relatives à l'état matrimonial (structure constante et structure variable) et trois hypothèses relatives aux taux de chefs (taux constants, faibles et forts). En associant de diverses façons ces hypothèses, il nous est maintenant possible de faire de nombreuses projections des ménages et des familles (voir appendice C). Après avoir fait une étude minutieuse des projections, nous en avons retenu quatre, de façon à couvrir l'éventail des possibilités de croissance du nombre de ménages et de familles au cours de la période 1971 - 2001. Les hypothèses sur lesquelles s'appuient ces quatre projections sont présentées de façon sommaire au tableau 5.1. Les projections ont été établies de façon très détaillée: selon l'âge, le sexe et l'état matrimonial du chef; selon le genre de ménage ou de famille; par province et territoire; pour chaque année jusqu'en 1986, puis par bonds de cinq ans jusqu'en 2001. Ces projections constituent une véritable mine de renseignements sur l'évolution future de la société canadienne. Faute de temps et de ressources, nous n'avons pas pu en analyser toutes les répercussions en profondeur; les résultats de cette analyse sont présentés dans les sections A et B, consacrées respectivement aux ménages et aux familles.

national level. However, these two projections may or may not be the "high" and "low" series respectively for every province and territory. Discussions in the following pages are generally centered on these two projections in order to emphasize the range of prospects at the national level. However, depending on their individual needs, the readers may decide to use a single projection out of the four, or others given in Appendix C.

### Increase in Households

**Period 1971 - 1986** — According to Projection 1, the number of households in Canada will be approximately 7,045,000 in 1976, or an increase of 983,000 over the total of 6,063,000 recorded at the 1971 Census. This means a rise of 16.2% during 1971 - 1976 compared to 16.6% in the period 1966 - 1971. Under Projection 4, shown in Table 5.2, the increase is expected to be 14.6%, or 885,000 households over the same period.

It may be cautioned that housing demand will not be equal to the projected increase in households. In addition to the increases in the number of households, housing demand depends upon several other factors such as the number of vacant units, the demolition of existing units or the conversion of units to other uses. However, the increase in households is the single most important factor governing the demand for housing in a given period.

Projections for the period 1976 - 1981 suggest a slight downward trend in the growth; nevertheless, the rates of increase will remain between 14% and 16%, which is far in excess of the projected 6% to 10% growth in population over the same period (see Chart 5.1). The number of households is expected to range from 7,927,000 to 8,146,000 in 1981 representing an increase of 976,000 to 1,100,000 households in this quinquennium. The projected growth during 1981-1986 is about 12% to 13% indicating a further drop in the rate of increase. As in the preceding quinquenniums, the household growth will be higher than the demographic growth. The fact that households are expected to increase faster than population may be attributed to the structure of future population of Canada, and in particular to the influence of the "baby boom". During 1971 - 1986 the entire baby boom generation will be in the age group 15 - 44 giving rise to a record increase of adults. This trend, coupled with a high headship rate among the young adult group, is expected to cause these high rates of increase in households (see Chart 5.1).

tivement à l'échelle nationale. Il est cependant possible que ces séries ne soient pas les projections "fortes" et "faibles" pour une province ou un territoire donné. Dans les pages qui suivent, nous nous attacherons principalement à ces deux projections de façon à examiner l'éventail des possibilités au niveau national. Le lecteur pourra toutefois sélectionner la ou les projections de son choix parmi les quatre que nous avons retenues ou parmi les autres qui sont données à l'appendice C.

### Augmentation du nombre de ménages

**Période 1971 - 1986** — Selon la projection 1, le nombre de ménages devrait s'établir à environ 7,045,000 en 1976, soit 983,000 de plus qu'en 1971 (6,063,000). Il s'agirait donc là d'une augmentation de 16.2 %; de 1966 - 1971, le nombre de ménages s'est accru de 16.6 %. Dans la projection 4 (tableau 5.2), l'accroissement s'établit à 14.6 % (885,000 ménages) au cours de la même période.

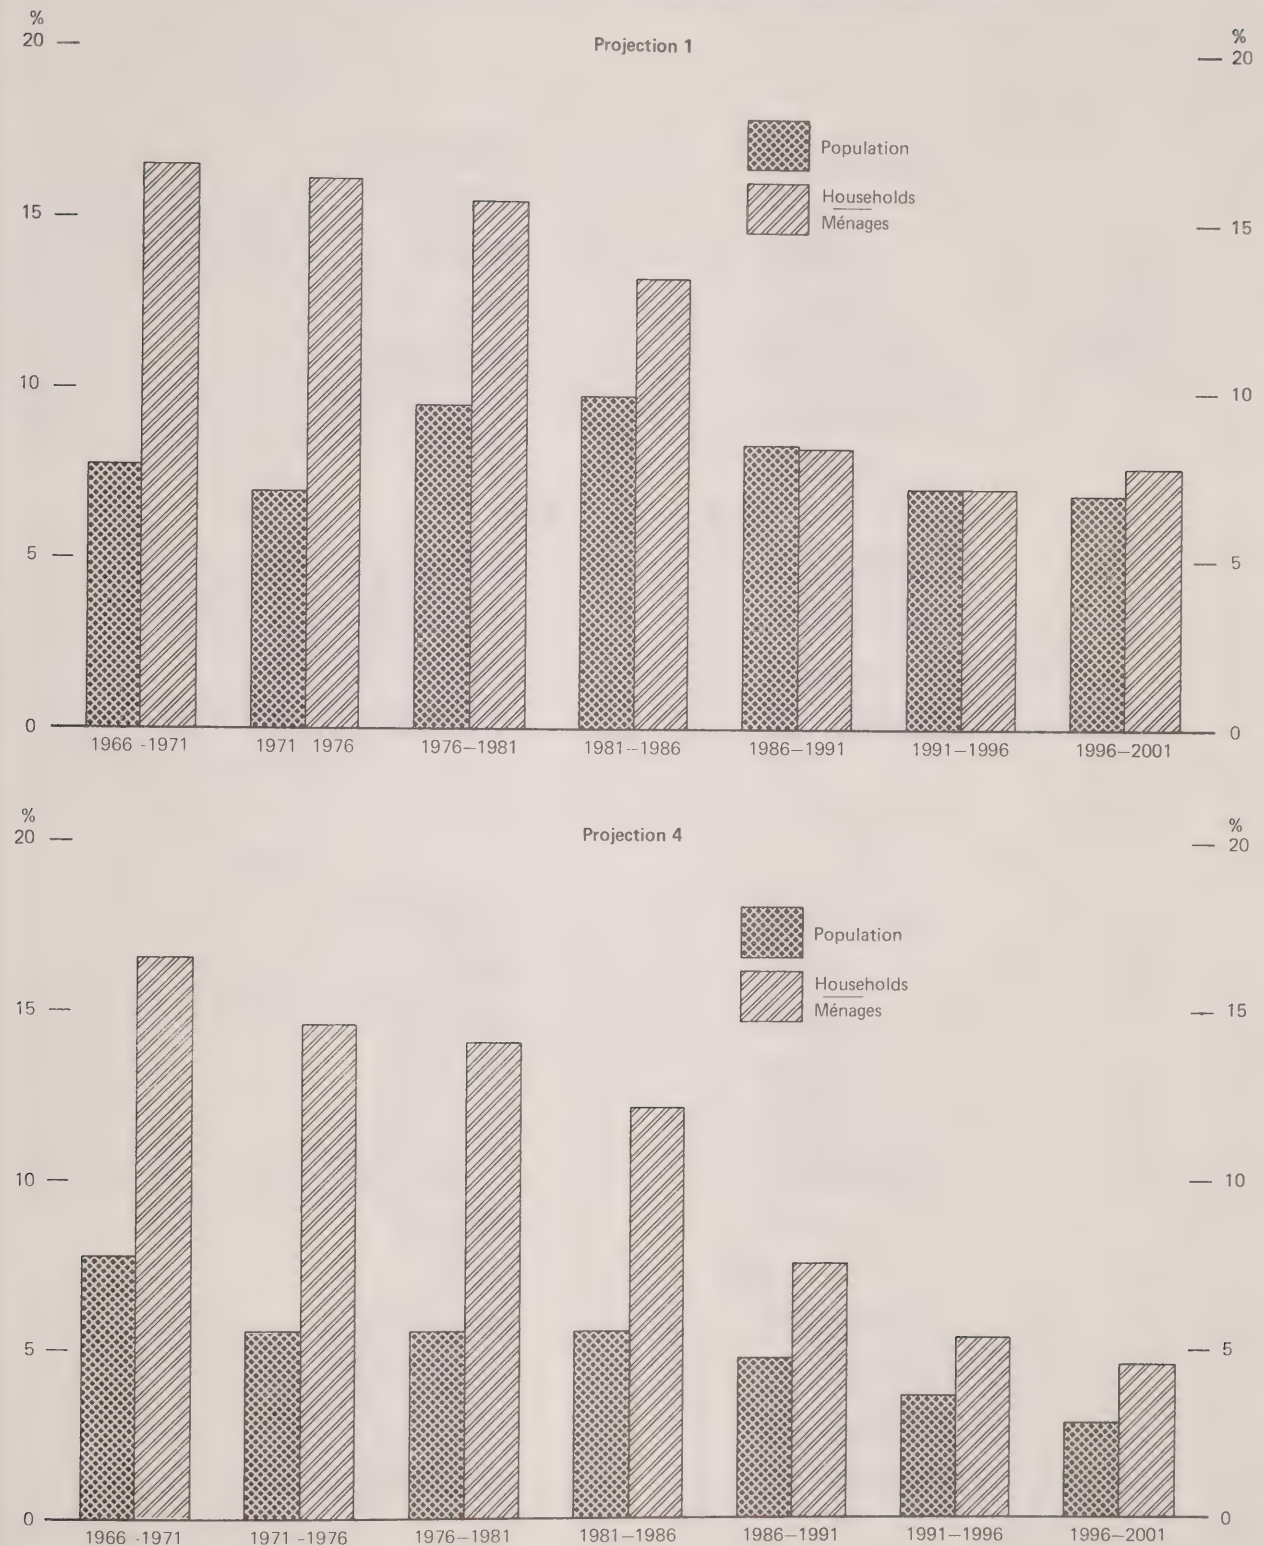

Nous tenons à attirer l'attention du lecteur sur le fait que l'augmentation de la demande de logements ne suivra pas forcément l'accroissement du nombre de ménages. En effet, la demande de logements ne dépend pas uniquement de l'accroissement du nombre de ménages, mais également de facteurs tels que le nombre de logements vacants et la démolition ou la transformation des logements existants. L'augmentation du nombre de ménages n'en demeure pas moins le principal facteur d'accroissement de la demande de logements au cours d'une période donnée.

D'après les projections établies pour la période 1976 - 1981, la croissance du nombre de ménages devrait ralentir quelque peu; le taux de croissance devrait néanmoins se situer entre 14 % et 16 %, ce qui est largement supérieur aux projections du taux de croissance démographique au cours de la même période (entre 6 % et 10 % — cf. graphique 5.1). Le nombre de ménages devrait se situer entre 7,927,000 et 8,146,000 en 1981, ce qui représente une augmentation de 976,000 à 1,100,000 ménages par rapport à 1976. Le taux de croissance projeté pour la période 1981-1986 s'établit à environ 12 % ou 13 %; le fléchissement observé au cours des cinq années précédentes devrait donc se maintenir. Tout comme au cours de la période 1976 - 1981, le taux de croissance des ménages devrait être supérieur au taux de croissance de la population. Ce phénomène peut être attribué à la structure future de la population du Canada, et en particulier à l'influence de l'explosion démographique de l'après-guerre (*baby boom*). Au cours de la période 1971 - 1986, les générations du *baby boom* appartiendront au groupe d'âges de 15 - 44 ans, ce qui donnera lieu à un accroissement sans précédent du nombre d'adultes. Associé à l'augmentation du taux de chefs chez les jeunes adultes, ce phénomène devrait être à l'origine de ce fort taux d'accroissement du nombre de ménages (graphique 5.1).

Source: See Appendix B and Part III. — Voir l'appendice B et la partie III.

The impact of the baby boom on household trends is also reflected in the projections for provinces shown in Table 5.2 and Chart 5.2. Since the adult group is highly mobile, this generation will have a significant impact on the future labour force in the provinces and thus on their demographic trends. In this respect, Projections 2 and 3 assume importance since they include different assumptions regarding interprovincial migration. As shown in Chart 5.2, all provinces would experience rates of increase in households that are higher than those of population during the next 15 years. In three provinces, namely Ontario, British Columbia and Alberta, the increase in both population and households would be considerably above the national average. The increase in Ontario is expected to be between 51% and 63% (or 3.4% to 4.2% a year) over the period 1971 - 1986. The rise will be about 53% to 63% in Alberta, and 57% to 75% in British Columbia (i.e., 3.8% to 5% per year). Also, Yukon and the Northwest Territories will witness very high rates of household growth, i.e., often over 5% a year (see Tables 5.2 and 5.3).

In Quebec, the increase is expected to vary between 41% and 44% in the same period. Compared to a projected gain of only 9% to 13% in total population, this household growth is seen to be substantial. A similar outlook is also evident from the household projections for provinces with low rates of population growth. Thus, Prince Edward Island, Nova Scotia and New Brunswick may expect a rise in the number of households between 28% and 36% over 1971 - 1986. The increase will be larger at about 45% to 50% in Newfoundland, reflecting a higher rate of population growth projected for this province.

Projections for Manitoba indicate an increase of 25% to 34%. Saskatchewan, according to Projections 2, 3 and 4, will experience an increase in households ranging between 4% and 19% in the period 1971 - 1986, while the underlying demographic projections imply a loss of population in the same period. In absolute terms, the total households in this province may number between 280,000 and 319,000 in 1986, i.e., an increase of 11,000 to 50,000 over the enumerated total of 269,000 households in 1971.

**Period 1986 - 2001** — Projections for this period are more uncertain since they are increasingly affected by the projected fertility trends after 1971. No one can be certain about the levels of fertility that will be attained in the future. Recent history provides ample evidence of unexpected swings in fertility. It is thus necessary to consider various alternative courses of fertility when projecting future population change.

L'incidence de cette explosion démographique sur l'évolution des ménages est également apparente au niveau provincial (cf. tableau 5.2 et graphique 5.2). Le groupe des adultes étant très mobile, ces générations auront une influence marquée sur la population active des provinces et, de ce fait, sur leur évolution démographique. Les projections 2 et 3 sont à cet égard particulièrement importantes, étant donné qu'elles s'appuient sur diverses hypothèses relatives aux migrations interprovinciales. Comme le révèle le graphique 5.2, le taux d'accroissement du nombre de ménages devrait être plus élevé que celui de la population dans l'ensemble des provinces au cours des 15 prochaines années. En Ontario, en Colombie-Britannique et en Alberta, l'accroissement de la population et du nombre de ménages devrait être considérablement supérieur à celui de la moyenne nationale. En Ontario, on prévoit qu'il se situera entre 51 % et 63 % au cours de la période 1971 - 1986 (ce qui représente une moyenne annuelle de 3.4 % à 4.2 %). En Alberta, cette augmentation devrait se situer entre 53 % et 63 % et en Colombie-Britannique, entre 57 % et 75 % (soit 3.8 % à 5 % par an). Le Yukon et les Territoires du Nord-Ouest devraient également enregistrer une très forte augmentation du nombre de ménages: souvent plus de 5 % par an (voir tableaux 5.2 et 5.3).

L'accroissement devrait s'établir entre 41 % et 44 % au Québec au cours de la même période. Si l'on songe au fait que l'accroissement démographique ne devrait se situer qu'entre 9 % et 13 %, cette augmentation du nombre de ménages est relativement importante. La situation est d'ailleurs analogue dans les provinces où le taux de croissance démographique est faible. Ainsi, à l'Île-du-Prince-Édouard, en Nouvelle-Écosse et au Nouveau-Brunswick, l'accroissement du nombre de ménages devrait se situer entre 28 % et 36 % de 1971 - 1986. L'augmentation devrait être supérieure à Terre-Neuve (de 45 % à 50 %); cette situation est attribuable au fait que cette province enregistrera un taux de croissance démographique plus élevé.

Les projections pour le Manitoba révèlent que le nombre de ménages devrait augmenter de 25 % à 34 %. Selon les projections 2, 3 et 4, le nombre de ménages en Saskatchewan devrait augmenter de 4 % à 19 % au cours de la même période, alors que les projections démographiques révèlent que la population de la province devrait diminuer. En chiffres absolus, le nombre total de ménages de cette province devrait se situer entre 280,000 et 319,000 en 1986, ce qui représente une augmentation de 11,000 à 50,000 par rapport à 1971 (269,000 ménages).

**Période 1986 - 2001** — Les projections pour cette période sont plus aléatoires, car elles sont davantage soumises aux effets des taux de fécondité projetés après 1971. En effet, nul ne peut déterminer avec précision quels seront les taux de fécondité dans le futur. On a en effet vu dans le passé de brusques variations dans l'évolution des taux de fécondité. Ainsi, au moment de faire des projections relatives à l'évolution d'une population, il est nécessaire d'étudier diverses hypothèses de fécondité.

As shown in Chart 5.1, the projected population and household increases in the latter part of the century present a certain contrast to the pattern anticipated during 1971 - 1986. According to Projection 1, which involves a high fertility assumption (representing a total fertility of 2.6 children per woman by 1985 and thereafter), the rate of increase in households will be approximately equal to the population growth after 1986. This is due to the fact that high fertility implies a large young population which is not subject to being household head. The increase in households, according to Projection 1, will be around 25% over the period 1986-2001, or about one half of the rate of increase during 1971 - 1986.

Should the present trend of low fertility persist on a long-term basis, as is implicit in Projection 4, the increase in the number of households will continue to be higher than population growth. The rate itself, however, will be less at about 19% over the entire period 1986-2001, compared to 47% during 1971 - 1986 under this low series. The pattern of markedly lower rate of increase in households after 1986 is also reflected in the provincial projections. For example, the anticipated growth in Ontario, Alberta and British Columbia will be just 24% to 28% during 1986 - 2001. The rate will be even smaller at about 10% in most other provinces. Yukon and Northwest Territories may experience an increase of over 30% in this period. It must be noted that these long-range provincial projections must be treated with considerable reserve since they are strongly affected by the internal migration assumptions. These projections are given mostly to indicate what would happen if certain conditions of the recent past were to continue. There is no doubt that other alternatives could well present themselves in the future.

### Indicated Changes in Household Structure

Besides the potential increases in the number of households described in the preceding paragraphs, the present projections reveal important changes in the age, sex and marital status characteristics of household heads. These changing characteristics, in turn, have various implications particularly for the housing industry but also for the economy and society as a whole. The population projections postulate various significant demographic changes such as replacement fertility, ageing of population, and geographic redistribution of the population. The household projections also imply various changes with regard to marriage, separation, divorce, family formation and family dissolution. Against this backdrop, some emerging features of projected changes in characteristics of household heads are highlighted below.

Comme le révèle le graphique 5.1, les accroissements projetés de la population et du nombre de ménages dans la dernière partie du siècle s'écartent quelque peu des tendances prévues pour la période 1971 - 1986. Selon la projection 1, dans laquelle on prévoit une descendance finale de 2.6 enfants par femme, le taux d'accroissement du nombre de ménages est à peu près égal à celui de la population après 1986. Cela est attribuable au fait que, lorsque le taux de fécondité est élevé, la population rajeunit; par ailleurs, les jeunes éléments de cette population ne peuvent pas être chefs de ménage. Toujours selon la projection 1, l'accroissement du nombre de ménages devrait être d'environ 25 % au cours de la période 1986-2001, soit environ la moitié du taux prévu pour la période 1971 - 1986.

Si la fécondité se maintenait au niveau faible observé au cours des années récentes (c'est l'hypothèse sur laquelle s'appuie la projection 4), l'accroissement du nombre de ménages continuerait à être supérieur à l'accroissement démographique. Toutefois, le taux ne se situerait qu'à 19 % au cours de la période 1986-2001 (contre 47 % de 1971 - 1986). Cette situation s'observe également au niveau provincial. Par exemple, le taux de croissance projeté pour l'Ontario, l'Alberta et la Colombie-Britannique ne devrait pas excéder 24 % à 28 % de 1986-2001. Dans la plupart des autres provinces, il ne devrait s'établir qu'à environ 10 %. Au Yukon et dans les Territoires du Nord-Ouest, par contre, le taux d'augmentation du nombre de ménages pourrait être supérieur à 30 % au cours de cette période. Il convient de souligner que ces projections provinciales à long terme doivent être utilisées avec discernement; elles dépendent en effet dans une large mesure des hypothèses relatives aux migrations intérieures. Ces projections sont donc avant tout destinées à nous donner une idée de ce qui pourrait arriver si certaines conditions observées dans le passé se maintenaient. Les choses pourraient en effet se passer de façon différente.

### Variations de la structure des ménages

En plus de mettre en lumière l'augmentation possible du nombre de ménages, nos projections nous permettent de constater que les caractéristiques (âge, sexe et état matrimonial) des chefs de ménage évolueront de façon sensible. Ces modifications pourront à leur tour avoir diverses répercussions non seulement sur le secteur de l'habitation, mais également sur l'économie et sur notre société dans son ensemble. Les projections démographiques ont proposé certaines évolutions significatives telles que le remplacement des générations, le vieillissement de la population et la redistribution géographique de la population. De même, les projections des ménages se fondent sur les variations de divers facteurs tels que le mariage, les séparations, les divorces, la formation et la dissolution des familles. C'est dans cette perspective que nous étudierons les points saillants des variations projetées des caractéristiques des chefs de ménage.

Source: Part III. – Partie III.

**Age pattern of household heads** — The post-war baby boom has already been pointed out to be a dominant demographic factor governing household trends during 1971 - 1986. The future increases in households would thus largely be a function of heads under 35 years of age. More than two fifths of the projected increase of 2,834,000 households (i.e., Projection 4, Table 5.4) occurs among heads aged less than 35 years. Overall, the proportion of these "young" households is expected to climb from 27.8% in 1971 to 32.7% of total households in 1986. This share could reach 33.8% under high Projection 1.

It may also be pointed out that another one fifth of the net additions to households during 1971 - 1986 will represent those of heads aged 65 years and over. This change again reflects the high fertility pattern before the depression. Besides, the past reduction of mortality among the old will contribute to the large increase of these households. The proportion of this group of households is anticipated to move up from 16.2% (or 984,000 households) in 1971 to 17.5% (or 1,553,000) of all households by 1986 according to Projection 4. This proportion will be 16.7% according to Projection 1 as shown in Table 5.4.

The magnitude of increase of households by age of head differs slightly for each quinquennium, i.e., 1971 - 1976, 1976 - 1981 and 1981 - 1986, depending on the movement of the baby boom cohorts through successive age groups over time. These different patterns are illustrated in Chart 5.3 which also brings out clearly that the increases during 1971 - 1986 will be heavily concentrated among household heads both below 35 years, and 65 years and over.

The foreseen shift towards young households will cease as the baby boom cohorts become older, and the smaller cohorts of the late 1960's start forming households by the last quarter of this century. This phenomenon is reflected in the age pattern of household heads during the period 1986 - 2001. Table 5.4 indeed shows that there could be decreases in young households (i.e., heads below 35 years) in this period according to Projection 4. This decrease is projected to be about 465,000, i.e., from 2,913,000 households with heads below 35 years old in 1986 to 2,449,000 by 2001. The proportion of these households will approximate 23.2% of all households (10,553,000) by the end of this century. Considering that consumption habits, income and life styles depend on the age of the household head, these changes in age patterns may be of great significance in the future.

**Household heads by sex and marital status** — Besides the age pattern, the marital status distribution of households has great implications for the economy and society. Table 5.5 shows that the increase in the number of households is due to the

**Âge des chefs de ménage** — Comme nous l'avons déjà souligné, l'explosion démographique de l'après-guerre est probablement le facteur qui agira le plus sur l'évolution des ménages de 1971 - 1986. En effet, l'accroissement du nombre de ménages sera dans une large mesure attribuable aux chefs de moins de 35 ans: selon la projection 4, plus des deux cinquièmes des nouveaux ménages — il y en aurait 2,834,000 — auraient un chef âgé de moins de 35 ans (cf. tableau 5.4). Dans l'ensemble, la proportion des "jeunes" chefs devrait passer de 27.8 % en 1971 à 32.7 % en 1986 (ou à 33.8 %, selon la projection 1).

Signalons également que, de 1971 - 1986, un cinquième des nouveaux ménages auront un chef de 65 ans et plus. Cette situation est imputable au fort taux de fécondité observé avant la dépression et à la diminution du taux de mortalité des personnes âgées. Selon la projection 4, la proportion des chefs de ménage de 65 ans et plus passera de 16.2 % (984,000 ménages) en 1971 à 17.5 % (1,553,000) en 1986. Dans la projection 1 du tableau 5.4, cette proportion s'établit à 16.7 %.

L'importance de l'accroissement du nombre de ménages en fonction de l'âge des chefs varie légèrement d'une période de cinq ans à l'autre (c'est-à-dire de 1971 - 1976, de 1976 - 1981 et de 1981 - 1986); ces variations sont attribuables à la progression en âge des générations du *baby boom*. Ces évolutions sont mises en évidence dans le graphique 5.3; ce graphique fait en outre clairement ressortir que les augmentations du nombre de ménages de 1971 - 1986 seront principalement attribuables aux chefs de moins de 35 ans et de 65 ans et plus.

Cette augmentation du nombre des "jeunes" ménages cessera quand les cohortes nées au cours de l'explosion démographique de l'après-guerre auront vieilli et que les générations creuses de la fin des années 60 commenceront à former des ménages. Ce phénomène est mis en évidence par la structure par âge des chefs de ménage au cours de la période 1986 - 2001. Le tableau 5.4 révèle en effet qu'il pourrait y avoir une diminution du nombre de "jeunes" ménages (ménages dont le chef a moins de 35 ans) au cours de cette période selon la projection 4. Cette diminution pourrait être d'environ 465,000 (de 2,913,000 en 1986 à 2,449,000 en 2001). Ces ménages devraient représenter environ 23.2 % de l'ensemble des ménages (10,553,000) vers la fin du siècle. Si l'on songe au fait que les régimes de consommation, le revenu et le mode de vie dépendent de l'âge du chef de ménage, ces variations pourraient revêtir une importance capitale.

**Sexe et état matrimonial des chefs de ménage** — La répartition selon l'état matrimonial des chefs de ménage peut avoir elle aussi des répercussions importantes sur l'économie et la société. Le tableau 5.5 montre que l'accroissement du nombre de ménages est non seulement

Source: See part III - Voir partie III

conventional factor of growth in husband-wife households, and above all to the rapid increases in households headed by persons in other marital status categories. With these larger increases at other marital status categories, there is a consequent **decrease** in the proportion of husband-wife households (male married spouse present). This category, which numbered 4,473,000 and formed 73.8% of total households in 1971, will decline to 71.9% by 1986 according to Projection 4. All other households will rise in relative share. The female married spouse absent category, which numbered 740,000 in 1971, will climb to 1,197,000 in 1986. Their relative share will rise from 12.2% to 13.5% of total households in the next 15 years. The households with married males spouse absent as heads are next in importance with an expected 5.2% of heads in 1986 according to Projection 4. Households with single male or female as household head will expand by about 50% each and number 452,000 and 391,000 respectively in 1986.

The general downward trend in the proportion of married spouse present households is expected across the country. Ontario, Quebec, Manitoba and Alberta may experience a considerable drop of 3% to 4% points in the proportion of husband-wife households which will be paralleled by a rise in the ever married spouse absent category. Due in part to relatively lower mortality, the proportion of female married spouse absent households will exceed 15% of all households in Manitoba and Saskatchewan compared to the national level of 13.5% in 1986 (Projection 4). Newfoundland, at the other end of scale, will have only 9% of households maintained by women married spouse absent. It might be noted that an exception to this general pattern is found in Prince Edward Island where the proportion of husband-wife households is anticipated to rise from 74.6% in 1971 to 75.5% in 1986. This increase will be accompanied by a drop in the proportion of male household heads who are single or married spouse absent.

### Prospective Trend in Non-family Households

Another important aspect deserving attention is the prospect of non-family households in Canada. In this study, a non-family household denotes that maintained by a person who is not a head of family (see Glossary in Appendix A). The present model, as described in Chapter 2, contains projections of family as well as non-family households. The non-family households numbered 1,165,000 and constituted about 19.2% of the total households at the time of the 1971 Census. According to Projection 4, the non-family households may rise to 1,915,000 by 1986. This will imply a slight increase in the proportion of non-family

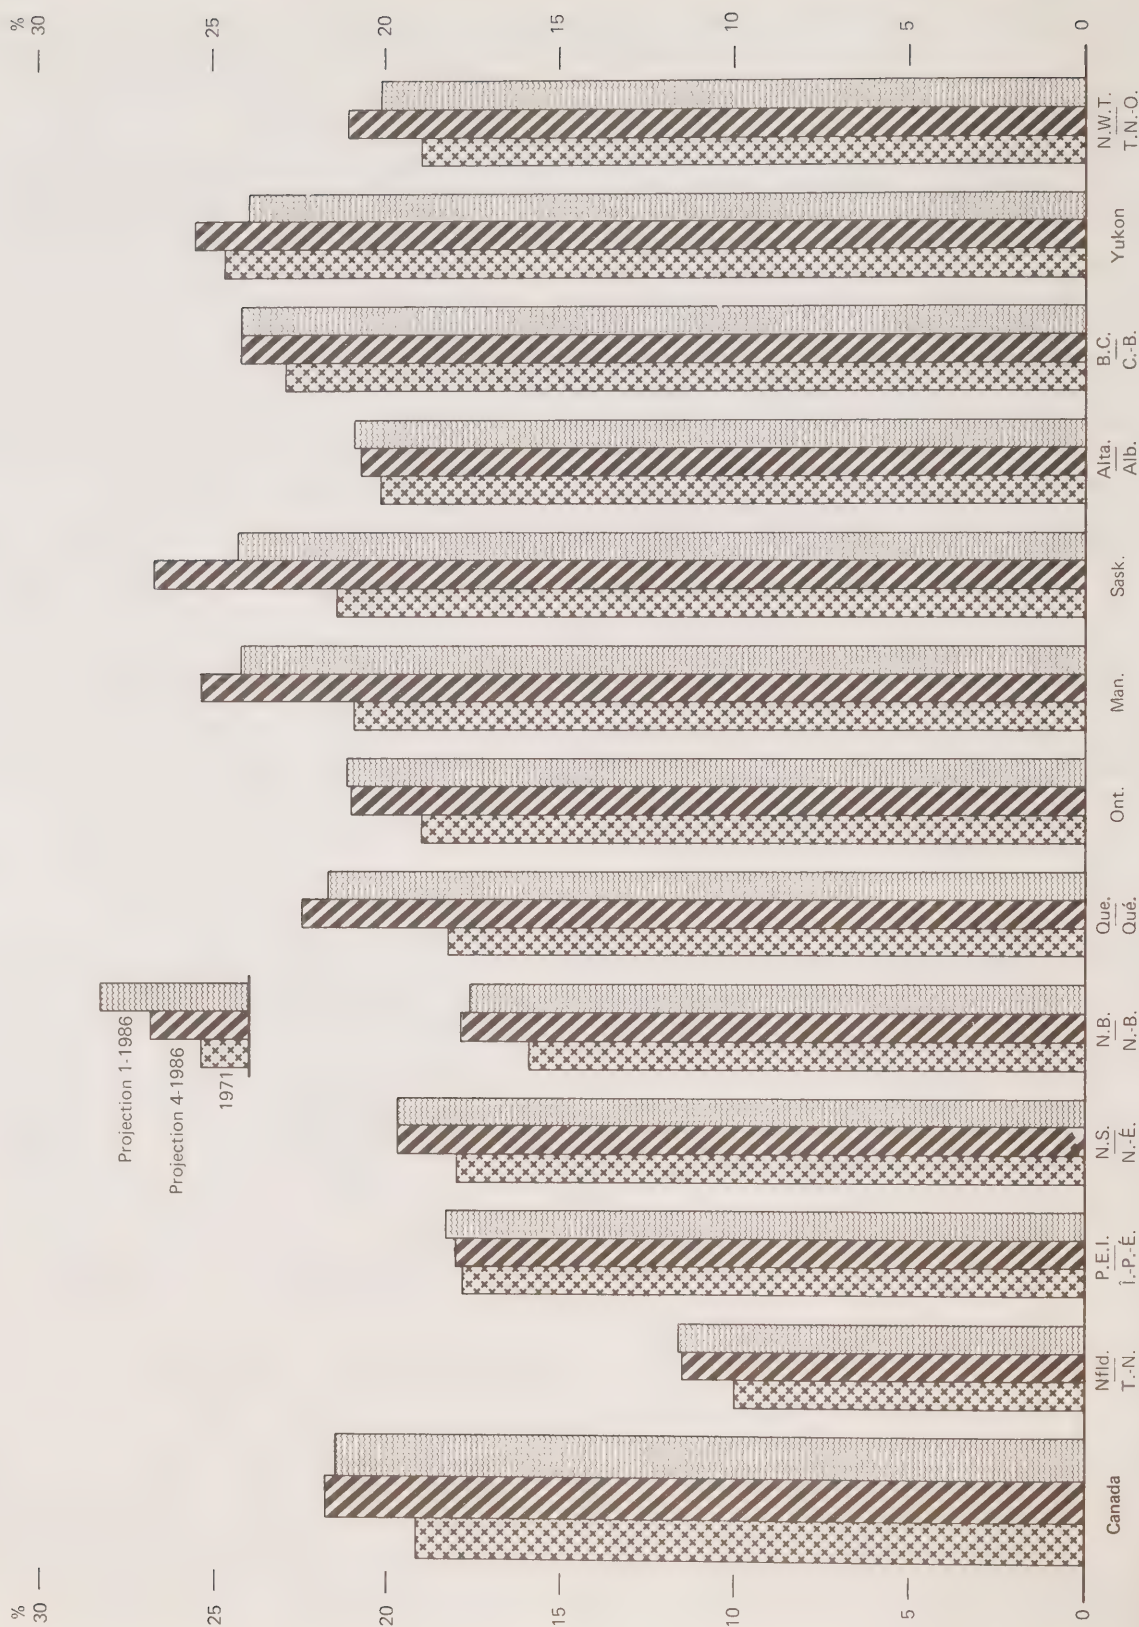

attribuable à des facteurs classiques tels que la croissance des ménages époux-épouse, mais surtout à l'accroissement rapide du nombre de ménages dont le chef appartient à d'autres catégories d'état matrimonial. On peut donc prévoir que la proportion des ménages époux-épouse (hommes mariés conjoint présent) **diminuera**. En effet, selon la projection 4, la proportion de ces ménages passera de 73.8 % (4,473,000) de l'ensemble des ménages en 1971 à 71.9 % en 1986. Par contre, la proportion des autres catégories de ménages s'accroîtra. Ainsi, le nombre de ménages dont le chef est une femme mariée dont le conjoint est absent passera de 740,000 en 1971 à 1,197,000 en 1986. Par rapport à l'ensemble des ménages, leur part passera donc de 12.2 % à 13.5 % au cours des 15 prochaines années. Les suivants en importance sont les ménages dont le chef est un homme marié dont le conjoint est absent, qui devraient représenter 5.2 % de l'ensemble des ménages en 1986 selon la projection 4. Les ménages dont le chef est un homme ou une femme célibataire s'accroîtront tous deux d'environ 50 % et passeront respectivement à 452,000 et 391,000 en 1986.

On prévoit en outre, pour l'ensemble du pays, une diminution de la proportion des ménages où le chef est une personne mariée dont le conjoint est présent. En Ontario, au Québec, au Manitoba et en Alberta, cette diminution pourrait s'établir à 3 % ou 4 %; elle devrait s'accompagner d'une augmentation du nombre de ménages dont le chef appartient à la catégorie des non-célibataires conjoint absent. Au Manitoba et en Saskatchewan, la proportion des ménages dont le chef est une femme mariée dont le conjoint est absent passera à plus de 15 % de l'ensemble des ménages en 1986 comparé à 13.5 % à l'échelle nationale (projection 4); cette situation est attribuable au fait que ces provinces enregistrent un taux de mortalité relativement moins élevé que les autres. À l'opposé, on observe qu'à Terre-Neuve, seulement 9 % des chefs de ménage seront des femmes mariées dont l'époux est absent. Contrairement à ce qu'on pourra observer dans les autres provinces, la proportion des ménages époux-épouse à l'Île-du-Prince-Édouard devrait passer de 74.6 % en 1971 à 75.5 % en 1986. Cette augmentation sera accompagnée d'une diminution de la proportion des chefs de ménage de sexe masculin qui appartiennent à la catégorie des célibataires ou des personnes mariées dont le conjoint est absent.

### Évolution des ménages non familiaux

Les tendances qu'on observera chez les ménages non familiaux du Canada méritent également quelques commentaires. Dans cette étude, un ménage non familial est un ménage dont le chef n'est pas chef d'une famille (voir glossaire de l'appendice A). Le modèle que nous avons utilisé (cf. description donnée dans le chapitre 2) nous permet d'obtenir des projections des ménages familiaux et des ménages non familiaux. Au recensement de 1971, il y avait 1,165,000 ménages non familiaux (soit environ 19.2 % de l'ensemble des ménages). Selon la projection 4, ce nombre pourrait passer à 1,915,000 en 1986. La proportion des ménages non familiaux devrait donc

Per Cent of Non-Family Households, Canada and Provinces, 1971 and 1986  
 Pourcentage de ménages non familiaux, Canada et provinces, 1971 et 1986

households to 21.5% in 1986. This type of household will be about 2,012,000 under high Projection 1. The non-family households in the country are projected to range from 2,278,000 to 2,572,000 by the end of the twentieth century.

The share of non-family households varies geographically as shown in Chart 5.5. Newfoundland reported the lowest proportion of this type, i.e., about 10% of all households in 1971. Yukon and British Columbia had the highest proportion of this type of households. The upward trend in the proportion of these households that is expected at the national level, may also occur in all provinces over the projection period, and reach between 11.6% in Newfoundland and 24.2% in Saskatchewan, British Columbia and Manitoba by 1986. Under Projection 1, this proportion may reach an even higher level at about 26.7% in Saskatchewan.

### B. Family Projections

The growth of families has a direct and significant effect on changes in the number and structure of households over the years. In the last Census, four fifths of households were family households of which the majority involved husband-wife families. Prospective changes in the number and composition of families, besides explaining the aforesaid trends in households, have important implications for future life styles, fertility patterns, as well as for the general economic and social fabric of the country. Some of these prospective changes are highlighted below.

#### Future Growth in Families

At the time of the 1971 Census, there were 5,071,000 families in Canada. According to the four projections selected in Table 5.1, the total families will number between 7,111,000 and 7,341,000 in 1986. To consider the long term, this total will reach between 8,411,000 and 9,129,000 by 2001 (see Table 5.6).

The growth of total families which stood at 12.0% in the quinquennium 1966 to 1971 (or 2.4% per annum), is expected to remain high at this level (i.e., between 2.3% and 2.7% per annum) until 1986. This rapid increase will take place as a result of the baby boom generation which will reach the prime ages of family formation during this period. After 1986, the rate of increase of families will come down considerably, i.e., as low as 1% per annum by the end of this century. It is noteworthy in Chart 5.6 that the annual growth rate of families is generally lower than that of households. However, during the period 1971 to 1986, the growth rate of families will be high and stable while that of households, as seen in Section A, will be high but decreasing.

s'établir à 21.5 % de l'ensemble des ménages en 1986. Selon la projection 1, il devrait y avoir près de 2,012,000 ménages non familiaux en 1986. Vers la fin du siècle, le nombre de ménages non familiaux devrait se situer entre 2,278,000 et 2,572,000.

Comme le révèle le graphique 5.5, les ménages non familiaux ne sont pas également répartis du point de vue géographique. Ainsi, c'est à Terre-Neuve que la proportion des ménages non familiaux était la moins élevée (environ 10 % de l'ensemble des ménages en 1971). À l'opposé, c'est au Yukon et en Colombie-Britannique qu'elle était la plus élevée. L'augmentation du nombre de ces ménages à l'échelle nationale devrait également se faire sentir dans chacune des provinces au cours de la période de projection et se situer entre 11.6 % à Terre-Neuve et 24.2 % en Saskatchewan, en Colombie-Britannique et au Manitoba en 1986. Selon la projection 1, cette proportion pourrait même atteindre un maximum de 26.7 % en Saskatchewan.

### B. Projections des familles

La croissance des familles exerce une influence profonde sur les variations du nombre et de la structure des ménages. Au dernier recensement, les quatre cinquièmes des ménages étaient des ménages familiaux; la majorité d'entre eux étaient composés de familles époux-épouse. En plus de nous permettre d'expliquer les tendances que nous avons observées en ce qui a trait aux ménages, l'évolution du nombre et de la composition des familles a une influence considérable sur le mode de vie de la population, les régimes de fécondité et la situation économique et sociale du pays. Nous passerons brièvement en revue quelques-unes de ces variations dans les pages qui suivent.

#### Croissance du nombre de familles

Au recensement de 1971, il y avait 5,071,000 familles au Canada. Selon les quatre projections présentées au tableau 5.1, le nombre total de familles devrait se situer entre 7,111,000 et 7,341,000 en 1986 et entre 8,411,000 et 9,129,000 en 2001 (voir tableau 5.6).

L'augmentation du nombre total de familles, qui s'est chiffrée à 12 % de 1966 à 1971 (soit 2.4 % par an), devrait se maintenir à ce rythme jusqu'en 1986 (entre 2.3 % et 2.7 % par an). Cette augmentation rapide est attribuable au fait que les personnes nées au cours de l'explosion démographique de l'après-guerre atteindront l'âge de formation de la famille au cours de cette période. Après 1986, le taux d'accroissement des familles diminuera considérablement, pour atteindre un creux de 1 % vers la fin du siècle. Il est intéressant de constater, à la lecture du graphique 5.6, que le taux de croissance annuel des familles est généralement inférieur à celui des ménages. Toutefois, de 1971 - 1986, le taux de croissance des familles sera élevé et stable, alors que celui des ménages sera élevé mais décroissant (voir section A).

### Indicated Changes in Family Composition

The age distribution of family heads naturally follows the changing age structure of the population. This point is well illustrated in Chart 5.7. In the age group 25 - 34, there is a substantial increase in the number of family heads between 1966 and 1991. A concomitant increase takes place in the age group 35 - 44 but it is over the period 1976 - 2001. Similarly, the increase in families with heads aged 45 - 54 will occur principally after 1986. Since families exhibit different behaviours in accordance with the age of their heads, these changes have important implications for social and economic policy.

Husband-wife families make up the majority of families. In the 1971 Census, 4,592,000 or 90.6% of families were of the husband-wife type. By 1986, there will be 6,648,000 (90.6%) husband-wife families according to Projection 1 or 6,485,000 (91.2%) according to Projection 4. It is thus expected that husband-wife families will constitute a stable (or slightly increasing) proportion of total families.

As indicated in Chapter 2, the projections were made separately for primary and secondary families. However, secondary families represented only 3.4% of total families in 1971. This proportion is expected to be reduced by half in 1986 (between 1.6% and 1.8%). Families, where the head is not a household head, may therefore constitute an increasingly negligible component of total families.

### Provincial Trends and Distributions

Table 5.7 presents the average annual growth rate of families by province or territory. The future growth rate, according to Projection 1, will be above the national average in Ontario, Alberta, British Columbia, Yukon and the Northwest Territories. In these areas the growth is expected to exceed 2.5% a year until 1986. Other provinces, excepting Saskatchewan, will experience a growth between 1.5% and 2.5% per annum. Under Projection 4, the interprovincial variations in the growth of families are expected to be less, and the growth rate for Saskatchewan is expected to be positive at about 1% a year during 1971 - 1986.

At the 1971 Census, 453,000 Canadian families, or 8.9%, lived in the Maritimes (see Table 5.6). By 1986, it is expected that the number of families in the Maritimes will rise to 587,000 (Projection 1) or 604,000 (Projection 4). These families will represent between 8.0% and 8.5% of Canadian families.

### Évolution de la composition des familles

La répartition par âge des chefs de famille suit évidemment l'évolution de la structure par âge de la population. Ce phénomène est bien mis en évidence par le graphique 5.7. Ainsi, on observe que le nombre de chefs de famille de 25 - 34 ans augmente de façon sensible de 1966-1991. Il en va de même chez les chefs de 35 - 44 ans, mais de 1976 - 2001. De même, c'est surtout après 1986 que le nombre des familles dont le chef est âgé de 45 - 54 ans s'accroîtra. Étant donné que le comportement des familles varie en fonction de l'âge de leur chef, ces variations ont des répercussions importantes du point de vue social et économique.

La majorité des familles sont des familles époux-épouse. Au recensement de 1971, il y avait 4,592,000 familles époux-épouse, ce qui représentait 90.6 % de l'ensemble des familles. En 1986, le nombre des familles époux-épouse passera à 6,648,000 (90.6 %) selon la projection 1 ou à 6,485,000 (91.2 %) selon la projection 4. On peut donc prévoir que la proportion des familles époux-épouse demeurera stable ou qu'elle s'accroîtra légèrement.

Comme nous l'avons souligné dans le chapitre 2, nous avons fait des projections distinctes pour les familles principales et les familles secondaires. Ces dernières, toutefois, ne représentaient que 3.4 % de l'ensemble des familles en 1971. Cette proportion devrait avoir diminué de moitié en 1986 et s'établir à environ 1.6 % ou 1.8 %. Les familles dont le chef n'est pas chef de ménage devraient donc représenter une part de moins en moins importante de l'ensemble des familles.

### Tendances et répartition provinciales

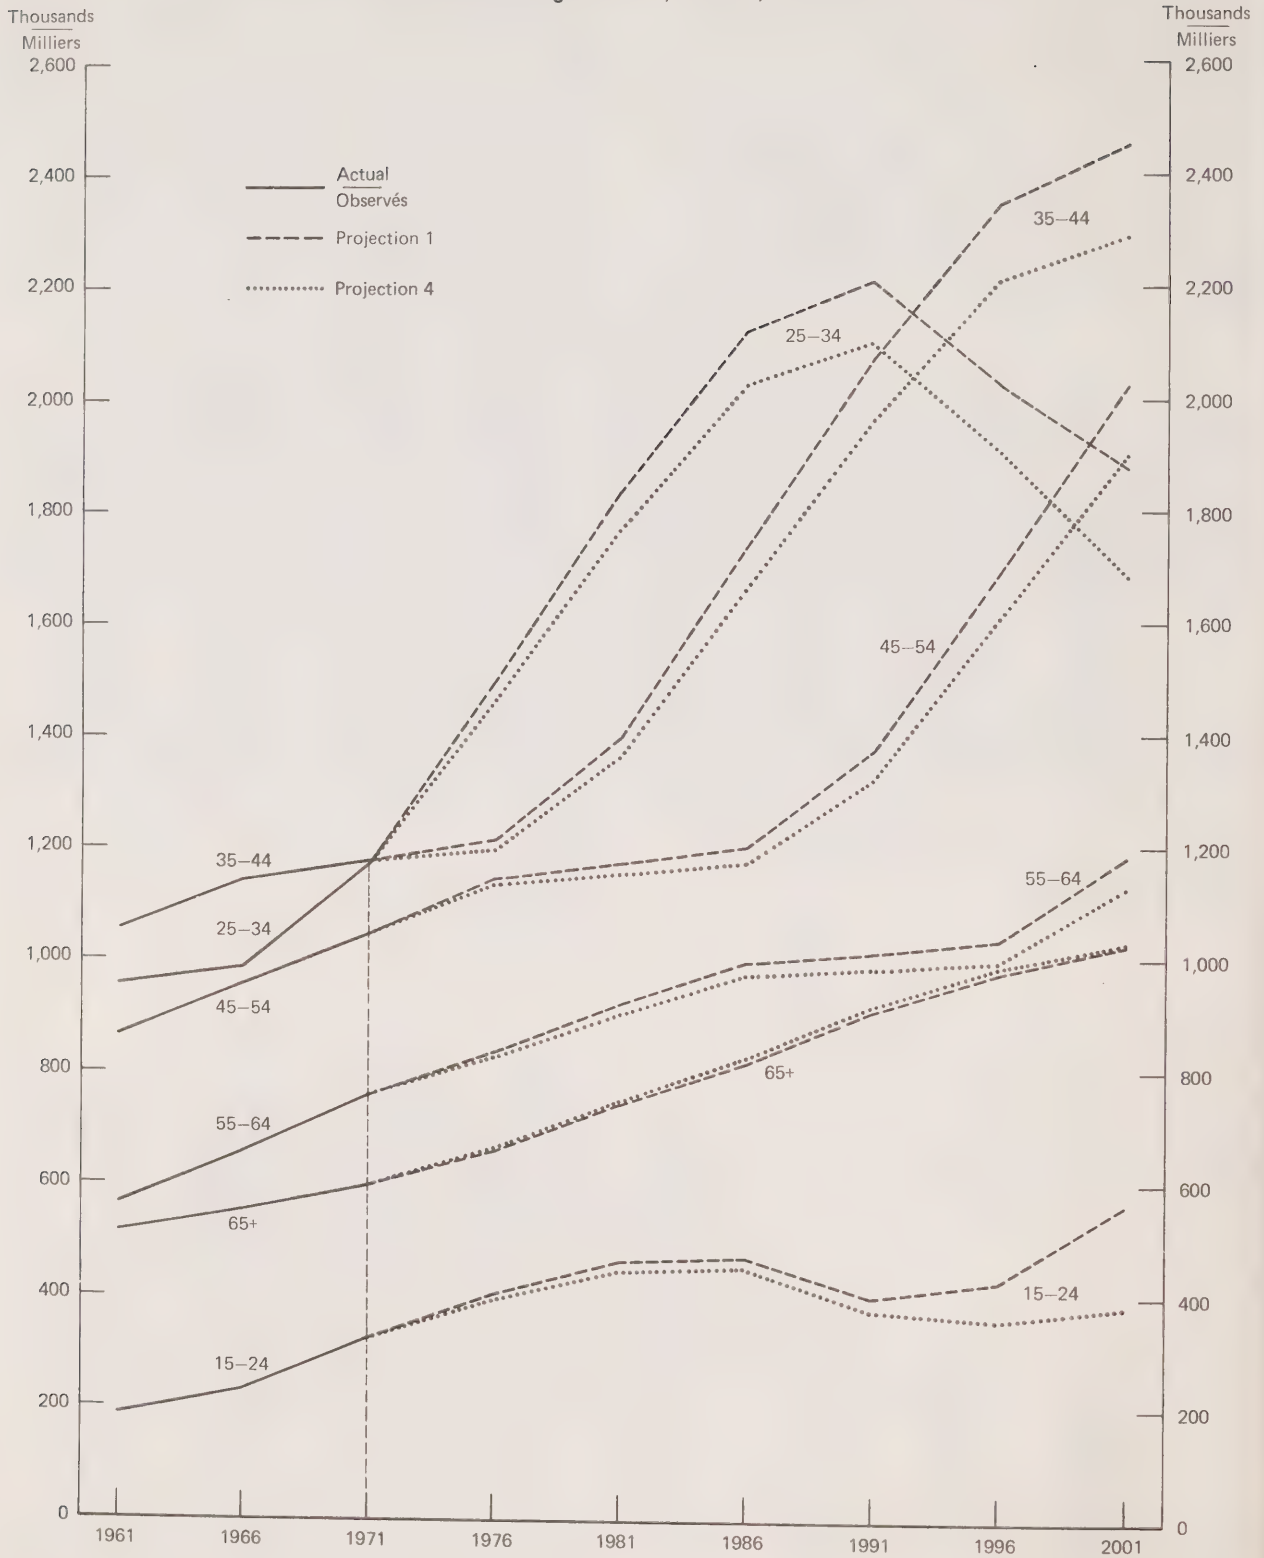

Le tableau 5.7 porte sur le taux annuel moyen de croissance des familles dans les provinces et les territoires. Selon la projection 1, le taux de croissance annuel des familles devrait être supérieur à la moyenne nationale en Ontario, en Alberta, en Colombie-Britannique, au Yukon et aux Territoires du Nord-Ouest et se maintenir à plus de 2.5 % jusqu'en 1986. Dans les autres provinces, exception faite de la Saskatchewan, il devrait se situer entre 1.5 % et 2.5 % par an. Selon la projection 4, les variations provinciales du taux de croissance des familles devraient être moins marquées, et le taux de croissance pour la Saskatchewan devrait être positif (environ 1 % par an de 1971 - 1986).

Au recensement de 1971, les Maritimes comptaient 453,000 familles, soit 8.9 % de l'ensemble des familles du Canada (voir tableau 5.6). En 1986, ce chiffre devrait passer à 587,000 (projection 1) ou à 604,000 (projection 4), soit respectivement 8.0 % et 8.5 % de l'ensemble des familles du Canada.

Source: See Appendix B and Part III. — Voir l'appendice B et la partie III.

In Quebec, there were 1,357,000 families in 1971 and by 1986 this number is expected to increase to 1,813,000 according to Projection 1 or 1,841,000 according to Projection 4. The figure for 1971 represents 26.8% of Canadian families while those for 1986 represent 24.7% and 25.9% respectively. Ontario had 1,882,000 families (37.1%) in 1971 and the projection results give 2,926,000 (39.9%) and 2,719,000 (38.2%) for 1986. Thus Ontario is expected to increase its proportional share of families.

The 1971 Census enumerated 834,000 families in the Prairie Provinces, constituting about 16.4% of Canadian families. By 1986 the figures, according to Projections 1 and 4, are expected to be 1,089,000 (14.8%) or 1,117,000 (15.7%). British Columbia had 534,000 (10.5%) families in 1971 and is expected to have 904,000 (12.3%) or 812,000 (11.4%) 15 years later. In the territories, there were 11,000 families in 1971 and there may be between 18,000 and 22,000 in 1986. Thus, according to Projections 1 and 4, Ontario, British Columbia and the territories would gain in their proportional share of families. In the other areas, i.e., the Maritimes, Quebec and the Prairies, there will be increases in the number of families but their proportional share of Canadian families may decrease between 1971 and 1986.

En 1971, le Québec comptait 1,357,000 familles (26.8 %); en 1986, ce chiffre pourrait s'établir à 1,813,000 (24.7 %), selon la projection 1, ou à 1,841,000 (25.9 %), selon la projection 4. En 1971, 1,882,000 familles (37.1 %) vivaient en Ontario; selon les projections, ce chiffre pourrait passer à 2,926,000 (39.9 %) ou à 2,719,000 (38.2 %) en 1986. Ainsi, la proportion du nombre de familles canadiennes vivant en Ontario devrait augmenter.

D'après les résultats du recensement de 1971, les provinces des Prairies comptaient à cette époque 834,000 familles, soit environ 16.4 % de l'ensemble des familles du Canada. En 1986, ces chiffres devraient respectivement passer, selon les projections 1 et 4, à 1,089,000 (14.8 %) ou à 1,117,000 (15.7 %). La Colombie-Britannique comptait 534,000 familles (10.5 %) en 1971; en 1986, ce chiffre pourrait s'établir à 904,000 (12.3 %) ou 812,000 (11.4 %). En 1971, 11,000 familles vivaient dans les Territoires; en 1986, il pourrait y en avoir entre 18,000 et 22,000. Ainsi, selon les projections 1 et 4, la proportion des familles vivant en Ontario, en Colombie-Britannique et dans les Territoires devrait augmenter. Dans les autres régions (provinces Maritimes, Québec et provinces des Prairies), elle devrait diminuer, même si le nombre absolu de familles s'accroît.

### Highlights of the Projections

The purpose of this final chapter is to highlight the main features that emerge from the analysis of household and family projections presented in this report. In particular, attention is focused on the dynamics of prospective changes in (a) the number of households and families, (b) the average size of households, (c) the types of households, (d) the age structure of household heads, and (e) the regional differentials with regard to the principal characteristics of households and families.

Among the 13 projections that have been produced, four are published in detail in this volume. Of these, Projections 1 and 4 are chosen here to highlight the future trends. Projection 1 implies a fertility of 2.6 births per woman, an annual net migration of 100,000 persons and headship rates based on trends during 1961 - 1971, and as such it could be regarded as a relatively "high" series. Projection 4 denotes a fertility of 1.8 births per woman, an annual net migration of 60,000 persons and headship rates based on trends during 1951 - 1971 and can be regarded as a relatively "low" projection. These qualifications apply to projections at the **national** level only. For the individual provinces, these two projections may or may not be the "high" and "low" series.<sup>1</sup> The selection of Projections 1 and 4 has been made on the grounds of analytical suitability and should not be construed as an expression by Statistics Canada of any preference for these projection series at the expense of others presented in this volume.

### Growth in Number of Households

The continuation of the post-war trend of rapid growth in the number of households throughout the 1970's and partly through the 1980's is undoubtedly one of the most significant features of these projections. From 3,351,700 in 1951, the number of households increased to 6,062,800 in 1971 and is expected by 1986 to reach 8,896,800 according to Projection 4 and 9,233,800 according to Projection 1. The expected annual rate of increase in the number of households during the 1970's, although somewhat lower than that experienced during the late 1960's, will be nonetheless very high at about 3%. What is significant, and somewhat surprising at first sight, is that this continuation of rapid growth in the number of households and families will be taking place in a demographic environment that is anticipated to be characterized by a considerable slowdown of population growth. Thus, whereas the Canadian population has grown annually at 2% and more during the 50's

### Traits saillants des projections

Dans ce dernier chapitre, nous allons tenter de faire ressortir les principales caractéristiques qui se dégagent de l'analyse des projections des ménages et des familles. Nous étudierons plus particulièrement les aspects dynamiques de l'évolution prévue: a) du nombre des ménages et des familles, b) de la taille moyenne des ménages, c) des divers types de ménages, d) de la structure par âge de leurs chefs, et e) des disparités régionales en ce qui a trait aux principales caractéristiques des ménages et des familles.

Des 13 séries de projections qui ont été établies, quatre sont incluses dans ce volume. L'analyse des projections 1 et 4 nous permettra de dégager les tendances générales de l'évolution prévue. Dans la projection 1, la fécondité se situe à 2.6 naissances par femme, la migration nette annuelle est de 100,000 personnes et les taux de chefs sont ceux établis à partir de l'évolution observée entre 1961 - 1971. C'est l'hypothèse "forte". Dans la projection 4, on a une fécondité de 1.8 naissances par femme, une migration annuelle nette de 60,000 personnes et des taux de chefs établis à partir de l'évolution observée entre 1951 - 1971. C'est ce qu'on pourrait appeler l'hypothèse "faible". Les projections 1 et 4 correspondent aux séries "fortes" et "faibles" à l'échelle **nationale**. Il est cependant possible que ces séries ne soient pas les projections "fortes" et "faibles" pour une province ou un territoire donné<sup>1</sup>. Le choix des projections 1 et 4 a été fait pour fins d'analyse seulement, et ne reflète en aucun cas les préférences de Statistique Canada pour l'une ou l'autre des projections.

### Accroissement du nombre de ménages

Une des principales caractéristiques de ces projections est sans contredit la poursuite jusque vers 1980 de l'accroissement rapide du nombre des ménages observé dans les années d'après-guerre. De 3,351,700 en 1951, le nombre des ménages a atteint 6,062,800 en 1971 et pourrait même atteindre 8,896,800 en 1986 (selon la projection 4) ou 9,233,800 (selon la projection 1). Durant la présente décennie, le taux annuel d'accroissement du nombre des ménages, quoique légèrement plus faible que durant la fin des années 60, pourrait se situer au niveau très élevé d'environ 3 %. Fait surprenant à signaler, cette croissance rapide du nombre des ménages et des familles est appelée à se produire dans un contexte de ralentissement considérable de la croissance démographique. Ainsi, alors que durant les années 50 et 60, la population canadienne augmentait au taux de 2 % et plus par année, ce taux n'était plus que de 1.3 % durant les dernières années et on s'attend à ce qu'il varie entre 1.2 % et 1.9 % d'ici 1986, selon les hypothèses de fécondité et de migration rete-

<sup>1</sup> See Tables 2.2 and 5.1 for the assumptions underlying various projections for the provinces and territories.

<sup>1</sup> Voir aux tableaux 2.2 et 5.1 les hypothèses de projections pour chaque province et territoire.

and 60's, its rate of increase dropped recently to 1.3% and, depending on future fertility and migration trends, is expected to fluctuate within a range of 1.2% and 1.9%, through the years up to 1986. Only after 1986 is the rate of increase in the number of households expected to line up more closely with the slow pace of population growth anticipated in the remaining decades of this century. The dynamics of changes, actual and potential, are presented in Table 6.1.

nues. Ce n'est qu'après 1986 que l'on peut s'attendre à voir le taux d'accroissement du nombre des ménages se rapprocher du rythme ralenti d'accroissement de la population prévu pour les dernières décennies du siècle. La dynamique du changement, présent et futur, est présentée au tableau 6.1.

Much of the rapid increase in the number of households during the 1971-1986 period can be attributed to the emerging age structure of the Canadian population. The most significant factor here is the baby boom generations who will reach the prime

Une grande partie de l'accroissement du nombre des ménages entre 1971-1986 est due à l'apparition d'une nouvelle structure par âge de la population canadienne. L'arrivée aux âges de formation de la famille des générations du *baby boom* en constitue le facteur le plus

ages of family formation and will establish their own households. For example, the number of persons 20-44 years of age is expected to increase by 46% to 51% from 1971-1986, whereas the increase for the previous 15 years in this age segment was only 29%.

A host of social and economic factors are also likely to contribute to the growing number of households in the future. Many young and old people are today financially better off than their predecessors. This trend, coupled with the changing attitudes toward privacy, may lead them to live apart from their families in greater numbers than in the past. The rise in the divorce rate will result in the establishment of new independent homes, some of which may be permanent while others only temporary in view of an equally rapid rise in the re-marriage rate. In recent years, the incidence of illegitimacy has exhibited an upward trend, and many of the unwed mothers may want and financially be able to set up their own homes rather than live with their families.

In general, one may say that the growing aspirations of various segments of the society for maintaining independent households has been greatly facilitated, in the past two decades or so, by the rising level of income of the people and by the greater availability of new housing units. The dwelling completions, for example, averaged 115,000 units a year during the period 1951-1960, and 153,000 units a year during the period 1961-1970.<sup>2</sup> However, in preparing these projections, no assumption has been made about the housing supply in future. The supply position can, of course, be an important accelerating or impeding factor in the future growth of the number of families and households.

### Average Size of the Household

Concomitant with the rapid growth anticipated in the preceding section, the projections reveal a tendency for the average household to become increasingly smaller in size. From a five-member household, that has been typical of the traditional Canadian society, the size has steadily fallen to slightly over four during 1951-1961, and then to 3.6 in 1971. Further decline is expected that may bring the average household size in the range of 2.7 to 3.0 persons before the turn of this century (Table 6.2).

While further shrinking in the household may be well anticipated as the outcome of tendencies toward establishment of own households that have been discussed in the preceding section, its exact future size

significatif. Ainsi, le nombre de personnes âgées de 20-44 ans pourrait augmenter de 46% à 51% entre 1971-1986, alors que la croissance de ce groupe d'âges, observée au cours des 15 dernières années, n'était que de 29%.

Une foule de facteurs d'ordre social et économique pourront également contribuer à l'accroissement futur du nombre des ménages. De nos jours, les jeunes tout aussi bien que les personnes âgées jouissent de revenus supérieurs à ceux de leurs aînés. Ce fait, ajouté à la modification des comportements individuels peut les amener à préférer habiter leur propre logement en plus grand nombre que dans le passé. L'augmentation du taux de divorce entraînera également la constitution de nouveaux ménages, certains à caractère permanent, d'autres sur une base temporaire, étant donné l'augmentation tout aussi rapide du taux de remariage. Durant les dernières années, on a assisté à une augmentation du nombre de naissances illégitimes; il est possible que de nombreuses mères célibataires, disposant de revenus accrus, souhaitent constituer leur propre ménage plutôt que de vivre avec leur famille.

De façon générale, on peut dire que les aspirations de divers sous-groupes de la société à constituer leur propre ménage ont pu se matérialiser grâce à l'accroissement des revenus d'une part et au plus grand nombre de logements disponibles d'autre part. Ainsi, le nombre de nouveaux logements construits a atteint en moyenne 115,000 unités par an de 1951-1960 et 153,000 de 1961-1970<sup>2</sup>. Nous n'avons pas tenu compte de l'offre future de logements dans les présentes projections. Cependant, il est évident que l'offre peut constituer un facteur d'accélération ou de ralentissement dans l'évolution du nombre des familles et ménages.

### Taille moyenne des ménages

Parallèlement à la croissance rapide anticipée dans les sections précédentes, on observe, dans les résultats des projections, une tendance vers une diminution de la taille des ménages. De cinq personnes dans la société canadienne traditionnelle, elle est passée à quatre au cours de la période 1951-1961, puis à 3.6 personnes en 1971. On s'attend à ce que cette tendance se poursuive, de sorte que la dimension moyenne des ménages pourrait se situer entre 2.7 et 3.0 personnes d'ici la fin du siècle (tableau 6.2).

Quoiqu'il soit possible de prévoir une diminution de la taille des ménages — résultat de la tendance à établir son propre ménage décrite à la section précédente — on ne peut prévoir de façon exacte la dimension future des

cannot be clearly foreseen. The critical variable determining the family and household size is fertility, and this has proven in the past to be quite volatile and therefore difficult to forecast.

ménages. La fécondité constitue ici un facteur déterminant et ses fluctuations, comme on a pu le constater dans le passé, sont difficiles à prédire.

### Types of Households

What are the different categories of households and their respective growth in the future? In an attempt to answer this question, Table 6.3 below presents the projections by five categories of households distinguished by the marital status of the head.

It appears that the conventional type, i.e., households headed by the husband remains still by far the most important type of household, but their rate of growth is expected to subside in the future. Consequently, their relative share in the total households may diminish from 74% in 1971 to about 71% by 1986. By contrast, the number of households headed by men who are either widowed, divorced or separated is anticipated to rise sharply during the same period. The percentage change in this category over the period 1971-1986 may well amount to 72% as opposed to 47% in the case of the husband-wife households. A rise of similar magnitude is foreseen for the category of households headed by formerly

### Les types de ménages

Quels sont les différents types de ménages et quelle sera leur évolution dans l'avenir? Afin de répondre à cette question, nous présentons au tableau 6.3 la projection de cinq types de ménages, selon l'état matrimonial du chef.

Il semble que le type de ménage traditionnel, celui dont le chef est l'époux, demeurera le type le plus important, mais son taux d'accroissement pourrait diminuer dans l'avenir, la part relative qu'il représente dans l'ensemble des ménages passant de 74 % en 1971 à environ 71 % en 1986. Par contre, le nombre de ménages dont le chef est veuf, divorcé ou séparé pourrait augmenter de façon marquée durant cette même période. Dans cette catégorie, l'augmentation pourrait atteindre 72 %, comparativement à 47 % pour les ménages époux-épouse (entre 1971-1986). Une croissance tout aussi forte est prévue pour les ménages dont le chef appartient au groupe "femmes non-célibataires". On observera également un accroissement du nombre des

married women. Another notable feature is the rising number of single males and females expected to set up private households. The following figures illustrate the upsurge of single households: in 1971 about 13% of single males and females over 15 years of age had their own households and by 1986 this percentage is expected to rise to about 21%. Changes in living arrangements, the growing quest for privacy and other demographic and socio-economic factors discussed before account for these trends in household characteristics.

célibataires, hommes ou femmes, qui établiront leur propre ménage. Les données qui suivent illustrent la croissance du nombre des ménages dans cette catégorie. En 1971, environ 13 % des célibataires, hommes ou femmes, de 15 ans et plus, possédaient leur propre ménage; en 1986, on s'attend à ce qu'ils représentent 21 %. Des changements de style de vie, l'aspiration à une plus grande autonomie et divers autres facteurs socio-économiques peuvent expliquer cette tendance de l'évolution des ménages.

TABLE 6.3. Actual and Projected Numbers of Households by Marital Status of the Head, Canada, 1971 - 1986

TABLEAU 6.3. Nombre de ménages selon l'état matrimonial du chef, Canada, 1971 - 1986

Marital status — État matrimonial	1971	1986		Total increase from 1971 - 1986 — Accroissement total de 1971 - 1986	
		Projection 1	Projection 4	Projection 1	Projection 4
		'000		%	
All heads — Tous chefs . . . . .	6,062.8	9,233.8	8,896.8	52.3	46.7
Male married spouse present — Hommes mariés conjoint présent . . . . .	4,472.5	6,567.2	6,398.3	46.8	43.1
Male single — Hommes célibataires . . . . .	299.4	515.0	452.1	72.0	51.0
Male ever married spouse absent — Hommes non célibataires conjoint absent . . . . .	287.0	488.4	459.2	70.2	60.0
Female single — Femmes célibataires . . . . .	264.2	432.1	390.5	63.6	47.8

Source: Part III. — Partie III.

In short, the projections indicate a growing importance of the non-family households in the future as compared to the more conventional family type of households. This tendency can also be measured by calculating the ratio of the number of families to that of households. Whereas this ratio was .98 in 1951, it dropped to .84 in 1971 and is expected to drop to less than .80 by 1986 or earlier.

### Age Structure

The age composition of household heads, along with the types of households reviewed above, are among the most important variables of the demand for housing facilities and related needs. In this respect, three specific age groups will probably have to be examined in greater detail because of the rapid increases they are expected to experience through

En résumé, les résultats des projections soulignent l'importance croissante du ménage non familial par rapport au ménage familial, de type plus traditionnel. Le rapport du nombre des familles au nombre des ménages rend également compte de cette tendance. Ainsi, ce rapport qui se situait à .98 en 1951, n'était plus que .84 en 1971 et on prévoit qu'il sera inférieur à .80 vers 1986.

### Structure par âge

La structure par âge des chefs de ménage, de même que les divers types de ménages présentés ci-dessus, comptent parmi les facteurs qui influent le plus sur la demande de logements et des services qui y sont associés. À cet égard, trois groupes d'âges retiennent l'attention par leur croissance rapide prévue jusqu'en 1986. Le premier groupe est constitué des chefs âgés de 25-34 ans,

1986. First is the group of heads 25 - 34 years old, who because of their age contribute greatly to the family formation cycle. As can be seen from Table 6.4, this will be the fastest growing group over the next 10 years and its size will increase from 1,268,000 in 1971 to between 2,289,000 and 2,418,000 in 1986 or from 80% to 90% over this period. The second group, consisting of the elderly people over 65 years, who may require special housing accommodations, will grow from 984,000 in 1971 to about 1,550,000 in 1986, i.e., an increase of 58% by 1986. Finally, the third group of 15 - 24 years old is composed of single people and newly married couples. An increase from 418,000 in 1971 to something in the range of 624,000 to 703,000 by 1986 is expected for this group.

c'est-à-dire à l'âge de former une famille. Le rythme d'accroissement de ce groupe sera le plus rapide durant les 10 prochaines années. De 1,268,000 en 1971, le nombre de chefs du groupe 25 - 34 ans oscillera entre 2,289,000 et 2,418,000 en 1986, soit une augmentation de 80 % à 90 %, selon les projections présentées au tableau 6.4. Le second est le groupe des personnes âgées. Ce groupe qui présente des besoins particuliers en ce qui concerne le logement, passera de 984,000 à environ 1,550,000 en 1986, soit une hausse de 58 %. Enfin, pour le troisième groupe, celui des 15 - 24 ans, constitué essentiellement de célibataires et de jeunes couples, on prévoit une augmentation importante: de 418,000 en 1971 à un nombre compris entre 624,000 et 703,000 en 1986.

### Regional Differentials

Among the various characteristics of households dealt with at the national level in the previous pages, the focus here is on the differences that exist between provinces and territories primarily with respect to the prospective growth trends in the number of households. Again the following highlights refer mainly to Projections 1 and 4, although for some provinces these do not represent “high” and “low” series. A more complete account of the growth picture for specific provinces will, therefore, require other projections to be considered as well.

### Disparités régionales

Dans la présente section, nous nous attacherons à décrire les disparités qui existent entre les provinces et territoires et l'analyse portera sur l'évolution prévue du nombre des ménages. Les projections 1 et 4 serviront aux fins de l'analyse, bien que pour certaines provinces, ces projections ne représentent pas nécessairement les hypothèses “forte” et “faible”. Pour obtenir une image plus nuancée des diverses possibilités de croissance de chaque province, il faudra compléter l'analyse par d'autres séries de projection.

As revealed in Table 6.5, differences of considerable magnitude in the rates of growth of the households do exist among provinces and territories. This is due to a variety of factors such as interprovincial differentials in the nuptiality patterns, incidence of illegitimacy and divorce, fertility levels, living arrangements, housing facilities, etc. But the most important factor, no doubt, is the future growth of population in the provinces and territories.

On constate à la lecture du tableau 6.5 que des différences considérables existent dans les taux de croissance des ménages des provinces et territoires. Ces différences peuvent être attribuées à divers facteurs, tels les disparités régionales de la nuptialité, l'importance des naissances illégitimes et des divorces, le niveau de fécondité, le mode de vie, le type de logements disponibles, etc. Le plus important est, sans contredit, l'évolution de la population des provinces et territoires dans les années à venir.

Northwest Territories - Territoires du Nord-Ouest	7.7	17.1	13.9	122.1	80.5

Source: Part III. - Partie III.

The fastest rate of growth in the number of households is anticipated for the Northwest Territories, followed by Yukon. The number of households in these two territories by 1986 may be twice as high as in 1971. Since the level of fertility in these territories is expected to remain high compared to that in the rest of Canada, the size of the household will be relatively large. Also one may anticipate a rather large proportion of single households in these areas.

Among the provinces, British Columbia will rank first in terms of the rate of household growth. From 671,600 in 1971, the number of households by 1986 may rise to a range of 1,053,800 to 1,173,800 implying an increase of 57% to 75% by 1986 according to the projections under review. This impressive growth

C'est dans les Territoires du Nord-Ouest, suivis de près par le Yukon, qu'on prévoit la croissance la plus rapide du nombre des ménages. En 1986, le nombre de ménages pourrait y être le double de ce qu'il était en 1971. Dans ces territoires, le haut niveau de fécondité maintiendra la dimension des ménages à un niveau relativement élevé. Une plus grande proportion des ménages non familiaux y est également prévue.

Parmi les provinces, c'est la Colombie-Britannique qui vient en tête quant au rythme d'accroissement du nombre des ménages. Selon les projections, le nombre des ménages qui était de 671,600 en 1971 pourrait varier entre 1,053,800 et 1,173,800 en 1986, soit une augmentation de 57 % à 75 %. Cela reflète la forte croissance

is a reflection primarily of the rapid population growth that this province will continue to experience, through an inflow of migrants from other provinces and abroad. However, due to its traditionally low fertility, the average size of family is and probably will remain below the national level.

British Columbia is followed closely by the provinces of Alberta and Ontario which may experience an increase between 52% to 62% over the 1971 - 1986 period. Again these provinces are anticipated to have high rates of population growth in the future.

Provinces that are expected to witness rates of household growth below the national level are the Maritime Provinces plus Manitoba. Newfoundland differs, however, from this group, since its rate of household growth, i.e., a rise of 45% to 50% over the period 1971 - 1986 may almost equal that of Canada as a whole.

The Quebec situation in this regard is somewhat special. On the one hand, the growth of its population is expected to undergo a considerable slowdown as a result of the sharp fall in fertility level and the continuous out-migration in recent years. Yet, on the other hand, its number of households may rapidly rise, from 1,611,800 in 1971 to over 2,300,000 in 1986, or an increase of approximately 43%. The main reason for this relatively rapid household growth is the emerging age structure characterized by a high proportion of persons in the prime ages of family and household formation. This emerging age structure is in turn the consequence of its past high fertility. The reduction in the average size of family may be, however, greater than in other provinces, in view of the recent and future fertility trends. From 3.7 persons per household in 1971, the average household size by 1986 may fall to 2.8 persons under relatively low fertility, and to 3.0 persons under relatively high fertility assumption.

The prospects of future growth in the number of households in the province of Saskatchewan will depend much on migration, and this is difficult to project. For several years consecutively, the out-migrants from Saskatchewan have outnumbered the in-migrants to this province, and consequently, it has sustained recurrent losses in its population. Since 1974, however, the trend in net migration has reversed itself, resulting in a population gain. Under the perspective of continuous loss in Saskatchewan's population, the number of households, observed in 1971 may remain stationary or even slightly decrease in future. The number of households will, however, increase from 268,800 in 1971 to 319,200 in 1986, if the size of migration loss, experienced through 1966 - 1971, is reduced by 50%, and to 341,700 if the province achieves a complete balance in its migration flow with other provinces.

démographique prévue pour cette province grâce à un solde migratoire fortement positif. Cependant, son faible niveau de fécondité maintiendra probablement la dimension moyenne des familles en dessous de la moyenne nationale.

L'Alberta et l'Ontario suivent de près; l'augmentation pourrait y être de l'ordre de 52 % à 62 % au cours de la même période. Pour ces provinces aussi, on prévoit une croissance démographique rapide dans l'avenir.

Quant aux provinces Maritimes et au Manitoba, le taux d'accroissement du nombre des ménages y sera probablement en dessous de la moyenne nationale. Terre-Neuve se détache nettement de ce groupe cependant, puisqu'une augmentation y est prévue (de 45 % à 50 % entre 1971 - 1986), pratiquement égale à celle de l'ensemble du Canada.

À cet égard, la position du Québec est quelque peu différente. D'une part, on prévoit un ralentissement considérable de la croissance de la population dû essentiellement à la chute de la fécondité et à l'émigration continue des dernières années. Par contre, le nombre des ménages pourrait augmenter rapidement passant de 1,611,800 en 1971 à plus de 2,300,000 en 1986 (environ 43 %). C'est l'émergence d'une nouvelle structure par âge, caractérisée par un gonflement des effectifs aux âges de formation des ménages et familles, qui est en grande partie responsable de cette croissance relativement forte du nombre des ménages. Cette structure par âge est la conséquence directe des hauts niveaux de fécondité passés. Cependant, étant donné les tendances récentes et futures de l'évolution de la fécondité, la réduction de la dimension des familles pourra y être plus grande que dans les autres provinces. De 3.7 personnes par ménage, en 1971, la dimension moyenne pourrait passer à 2.8 personnes dans l'hypothèse de fécondité faible et à 3.0 personnes dans l'hypothèse forte.

En Saskatchewan, l'évolution du nombre des ménages est fortement liée aux migrations, difficiles à prévoir. Durant plusieurs années, le nombre de sortants y a été plus élevé que le nombre d'entrants. Mais depuis 1974, on assiste à un renversement de cette tendance et la population s'accroît. Dans l'hypothèse d'une baisse continue de la population, le nombre de ménages observé en 1971 pourra demeurer stationnaire dans les années à venir ou même se réduire quelque peu. Le nombre des ménages pourrait cependant augmenter, passant de 268,800 en 1971 à 319,200 en 1986 si le déficit migratoire, enregistré durant la période 1966 - 1971, diminuait de 50 %, et à 341,700 dans une situation de migration nulle, les sorties et les entrées s'équilibrant.

## Glossary of Selected Terms

**Collective household** — A household occupying a collective dwelling. A collective dwelling refers to a dwelling in which a large number of persons are likely to reside.

**Ever-married spouse absent** — All persons who are neither **single** nor **married spouse present**. This includes widowed, divorced as well as all other cases of once married persons who are not living with their husband or wife.

**Family** — Consists of a husband and wife (with or without children who have never been married, regardless of age) or a parent with one or more children never married, living in the same dwelling.

**General headship rate** — The number of heads (of families or of households) per 100 persons aged 15 years and over.

**Head of family** — The husband in a husband-wife family, or the parent in a one parent family.

**Head of household** — For Census purposes, every household must have a head. This is the husband if both husband and wife are present, the parent if living with unmarried children, or any member of a group sharing a dwelling equally; a person occupying a dwelling alone is always reported as head.

**Headship rate** — The number of heads (of households or of families) per 100 persons in a given population.

**Household** — A person or group of persons occupying one dwelling. Every person is a member of some household. A dwelling refers to a structurally separate set of living quarters with a private entrance from outside or from a common hallway or stairway inside the building, i.e., the entrance must not be through someone else's living quarters. In this report, households always include both **private** and **collective** households.

**Married spouse present** — Persons who are living with their husband or wife. Persons living common-law are considered as married.

**Non-family household** — A household in which the head of the household is not the head of a family. A non-family household can include a family (**secondary family**) but in this case the head of the family will not be the head of the household. Note that the term non-family household is defined differently in certain Census tabulations where it implies that no family is living in the household.

## Glossaire sélectif

**Célibataire** — Personne qui n'a jamais été mariée (y compris toute personne de moins de 15 ans), ou personne dont le mariage a été annulé.

**Chef de famille** — L'époux dans une famille époux-épouse, ou le père ou la mère dans une famille monoparentale.

**Chef de ménage** — Aux fins du recensement, chaque ménage doit avoir un chef. Le chef est l'époux lorsque les deux conjoints sont présents, le père ou la mère s'il n'y en a qu'un des deux avec des enfants célibataires, ou n'importe quel membre d'un autre groupe se partageant un logement à parts égales; une personne occupant seule un logement est toujours le chef.

**Famille** — Époux et épouse avec ou sans enfants célibataire (peu importe leur âge), ou l'un ou l'autre des parents avec un ou plusieurs enfants célibataires vivant dans le même logement.

**Famille principale** — Famille dont le chef est aussi chef de ménage.

**Famille secondaire** — Famille dont le chef n'est pas le chef du ménage.

**Ménage** — Personne ou groupe de personnes occupant un même logement. Chaque personne est membre d'un ménage. Un logement est un ensemble structurel distinct de pièces d'habitation ayant une entrée privée donnant sur l'extérieur ou sur un corridor ou un escalier commun à l'intérieur, c'est-à-dire que l'entrée doit donner accès au logement sans qu'on ait à passer par les pièces d'habitation de quelqu'un d'autre. Dans cette étude, les ménages comprennent les **ménages privés** et les **ménages collectifs**.

**Ménage collectif** — Ménage occupant un logement collectif. Un logement collectif est un logement dans lequel peuvent habiter un grand nombre de personnes.

**Ménage non familial** — Ménage dont le chef n'est pas le chef d'une famille. Un ménage non familial peut comprendre une famille (**famille secondaire**) mais, dans ce cas, le chef de la famille ne sera pas chef du ménage. On remarquera que le terme ménage non familial est défini différemment dans certains tableaux du recensement où il sert à désigner les ménages qui ne comprennent pas de famille.

**Ménage privé** — La ou les personnes qui occupent un logement privé. Un logement privé peut être occupé par une personne, une famille ou un autre petit groupe de personnes (par exemple, une maison individuelle, un appartement, etc.).

**Primary family** — A family in which the head of the family is also the head of the household.

**Private household** — A person or group of persons occupying a private dwelling. A private dwelling refers to a dwelling in which one person, a family, or other small group of individuals may reside, such as a single house, apartment, etc.

**Secondary family** — A family in which the head of the family is not the head of the household.

**Single** — Persons who never married (including all persons less than 15 years) and persons whose marriage was annulled.

**Total headship rate** — The number of heads of all types (head of primary family, head of secondary family, head of non-family household) per 100 persons in a given population.

**Marié conjoint présent** — Personne qui vit avec son conjoint. Les personnes vivant en union consensuelle sont considérées comme mariées.

**Non-célibataire conjoint absent** — Personne qui n'est ni célibataire ni mariée conjoint présent. Cette catégorie comprend les veufs, les divorcés et toute autre personne non-célibataire qui ne vit pas avec son conjoint.

**Taux de chefs** — Pourcentage de chefs (de ménage ou de famille) au sein d'une population donnée.

**Taux de chefs global** — Pourcentage de chefs de tous types (chefs de famille principale, chefs de famille secondaire, chefs de ménage non familial) au sein d'une population donnée.

**Taux général de chefs** — Pourcentage de chefs (de ménage ou de famille) au sein de la population de 15 ans et plus.

## APPENDIX B

### Sources of Base Data

#### 1. Marital Status for Single, Married, Widowed and Divorced

- 1951: Unpublished Statistics Canada data, Cassette No. 10203 (Binder No's. 10 and 11).  
1956: Unpublished Statistics Canada data, Cassette No. 10401 (Binder No. 7).  
1961: Census of Canada, Vol. I (3), Table 78.  
1966: Census of Canada, Vol. I (13), Table 34.  
1971: Census of Canada, Vol. I (4), Tables 1 and 2.

#### 2. Marital Status for Married Spouse Present

- 1951: Census of Canada, Vol. III, Table 143.  
Unpublished Statistics Canada data, Cassette No. 20002 (Run No. 16, Binder No. 4).  
1956: Census of Canada, Vol. I, Table 57.  
Unpublished Statistics Canada data, Cassette No. 20001 (Run No. 19).  
1961: Census of Canada, Vol. 2 (1), Table 95.  
Unpublished Statistics Canada data, Cassette No. 22042 (code 371/1).  
1966: Census of Canada, Vol. 2 (12), Table 83.  
Unpublished Statistics Canada data, Cassette No. 22017 (code 606 DUC/1).  
1971: Unpublished Statistics Canada data, Cassette No. 22072 (code FC GEN-9(C)D1).

#### 3. Household and Family Heads

- 1951: Census of Canada, Vol. III, Tables 100 and 136.  
Unpublished Statistics Canada data, Run No's. 4, 7 and 16. See also No. 4 below.  
1956: Census of Canada, Vol. I, Table 58.  
Unpublished Statistics Canada data, Run No. 16.  
1961: Census of Canada, Vol. 2.1, Table 98.  
Unpublished Statistics Canada data, Cassette No's. 22031 and 27031.  
1966: Census of Canada, Vol. 2 (12), Table 93.  
Unpublished Statistics Canada data, Cassette No's. 27012 and 22016.  
1971: Census of Canada, Vol. 2.1-12, Table 85.  
Unpublished Statistics Canada data (code FC GEN-1(A1)).

## APPENDICE B

### Sources des données de base

#### 1. État matrimonial de personnes célibataires, mariées, veuves et divorcées

- 1951: Données non publiées de Statistique Canada, cassette n° 10203 (programmes n°s 10 et 11).  
1956: Données non publiées de Statistique Canada, cassette n° 10401 (programme n° 7).  
1961: Recensement du Canada, vol. I (3), tableau 78.  
1966: Recensement du Canada, vol. I (13), tableau 34.  
1971: Recensement du Canada, vol. I (4), tableaux 1 et 2.

#### 2. État matrimonial des personnes mariées dont le conjoint est présent

- 1951: Recensement du Canada, vol. III, tableau 143.  
Données non publiées de Statistique Canada, cassette n° 20002 (passage n° 16, programme n° 4).  
1956: Recensement du Canada, vol. I, tableau 57.  
Données non publiées de Statistique Canada, cassette n° 20001 (passage n° 19).  
1961: Recensement du Canada, vol. 2 (1), tableau 95.  
Données non publiées de Statistique Canada, cassette n° 22042 (code 371/1).  
1966: Recensement du Canada, vol. 2 (12), tableau 83.  
Données non publiées de Statistique Canada, cassette n° 22017 (code 606 DUC/1).  
1971: Données non publiées de Statistique Canada, cassette n° 22072 (code FC GEN-9(C)D1).

#### 3. Chefs de ménage et de famille

- 1951: Recensement du Canada, vol. III, tableaux 100 et 136.  
Données non publiées de Statistique Canada, passages n°s 4, 7 et 16. Voir également n° 4 ci-dessous.  
1956: Recensement du Canada, vol. I, tableau 58.  
Données non publiées de Statistique Canada, passage n° 16.  
1961: Recensement du Canada, vol. 2.1, tableau 98.  
Données non publiées de Statistique Canada, cassettes n°s 22031 et 27031.  
1966: Recensement du Canada, vol. 2 (12), tableau 93.  
Données non publiées de Statistique Canada, cassettes n°s 27012 et 22016.  
1971: Recensement du Canada, vol. 2.1-12, tableau 85.  
Données non publiées de Statistique Canada (code FC GEN-1(A1)).

#### 4. Estimates for Unavailable Household and Family Data for 1951

The data for household and family heads in 1951 gives ages 15 - 34 as the lowest age group. This was broken down into ages 15 - 24 and 25 - 34 in accordance with corresponding proportions in 1956. Various sub-totals were not available for non-family heads. These also were obtained by applying ratios from 1956. In addition, no data are available for non-family heads in Yukon and Northwest Territories. These data were not estimated. Instead, the 1956 data were used in projection Hypothesis A (with appropriate changes in the projection formulae).

#### 4. Estimations de données sur les ménages et les familles non-disponibles pour 1951

En 1951, le plus "jeune" groupe d'âges utilisé pour les chefs de ménage et de famille était le groupe de 15 - 34 ans. Ce groupe a dû être subdivisé en 15 - 24 ans et 25 - 34 ans en fonction des proportions de 1956. De plus, divers totaux partiels n'étaient pas disponibles pour les chefs de ménage non familial. Ces chiffres ont également été obtenus à l'aide des proportions observées en 1956. De plus, il n'y avait pas de données disponibles pour les chefs de ménage non familial du Yukon et des Territoires du Nord-Ouest. Ces données n'ont pas été estimées. Nous avons en effet préféré utiliser les données de 1956 dans les projections s'appuyant sur l'hypothèse A, les formules de projection ayant été modifiées en conséquence.

# APPENDIX – C – APPENDICE

## Alternative Projections – Autres projections

**TABLE C.1. List of Projections based on Various Combinations affecting Household and Family Growth**
